

CSC4200/5200 – COMPUTER NETWORKING

Instructor: Susmit Shannigrahi

ARP AND DHCP

sshannigrahi@tntech.edu

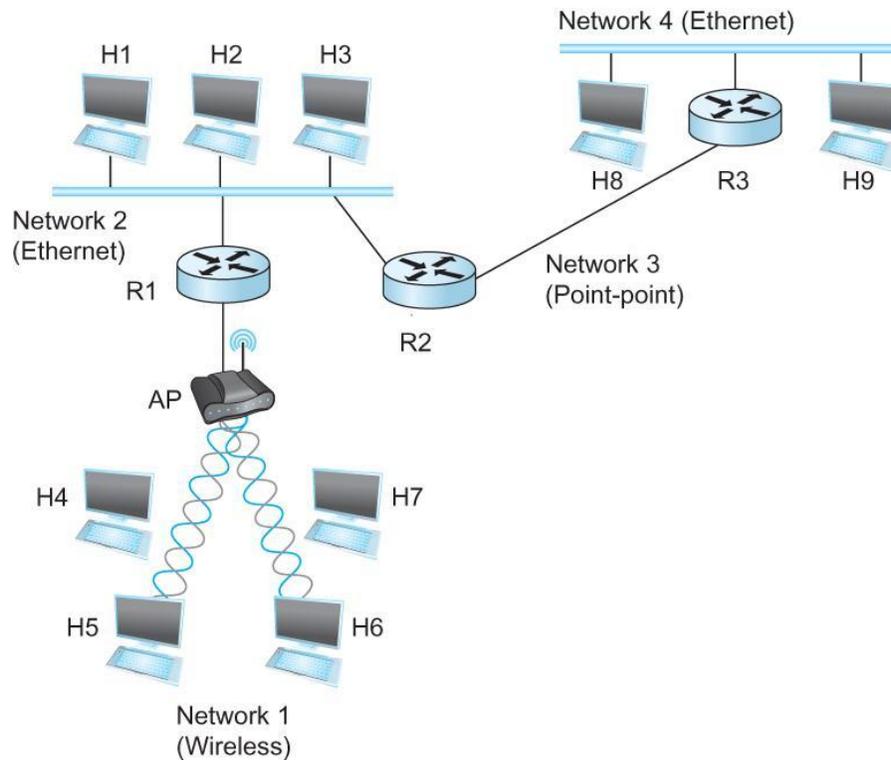

Bits (1010001)

So far...

- We now know how to address hosts and networks!
- Subnetting for scale

Internetworking Protocol (IP)

- What is an internetwork?
 - An arbitrary collection of networks
 - provide some sort of host-host to packet delivery service

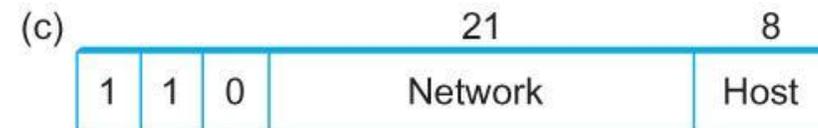

Global Address in IP – Each node has an unique address

- A 32 bit number in quad-dot notation
- Identifies an **Interface**
 - **A host might have several interfaces!!!**

- 129.82.138.254

10000001.01010010.10001010.11111110

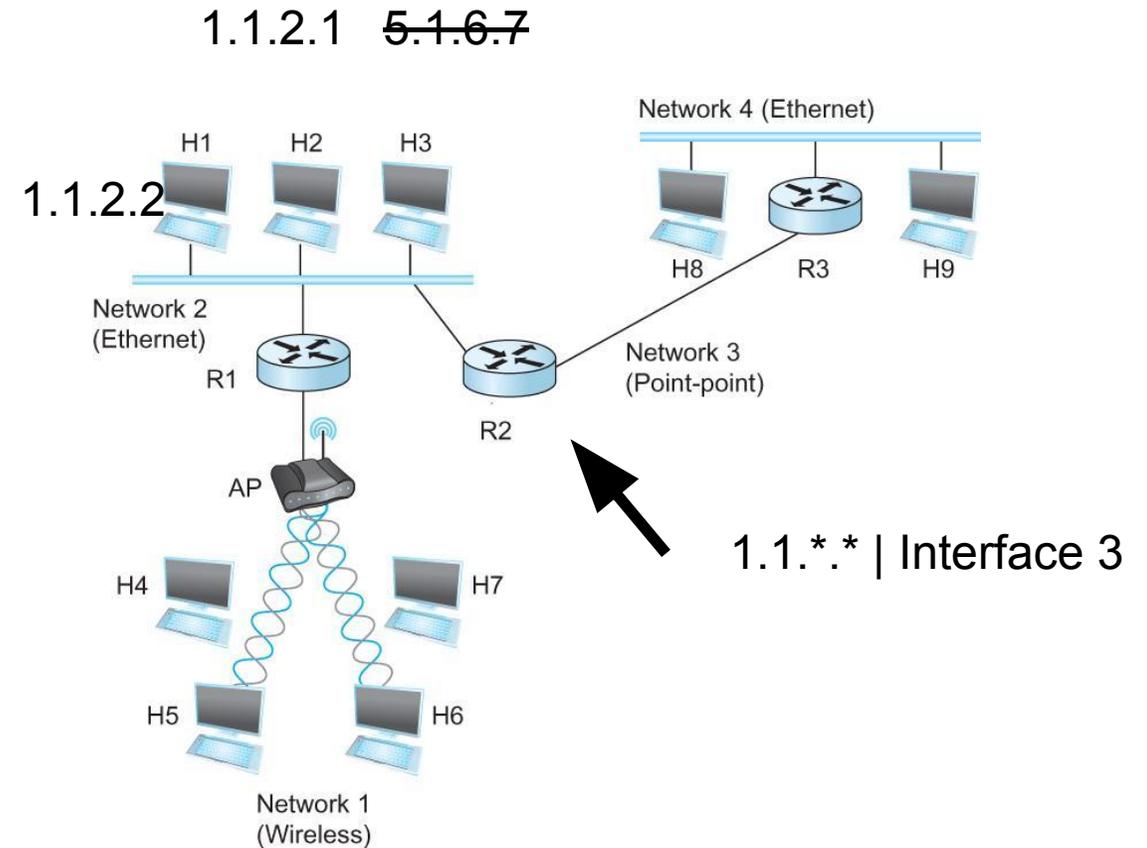

IP addresses are in Network + Host

- 1.1.2.1 →
 - 1.1 → Network part
 - 2.1 → host part
- Each octet can range from 1- 255
- Hierarchical address

129.82.138.254

10000001.01010010.10001010.11111110

Network part (24 bits). Host part(8 bits)

Calculate the first and the last IP address of a subnet

129.82.138.254/27

First host - host bits 0

10000001.01010010.10001010.11111110

11111111.11111111.11111111.11100000 (LOGICAL AND)

10000001.01010010.10001010.11100000 → 129.82.138.224

Last host - host bits 1

10000001.01010010.10001010.11111110

11111111.11111111.11111111.11111111 (LOGICAL AND)

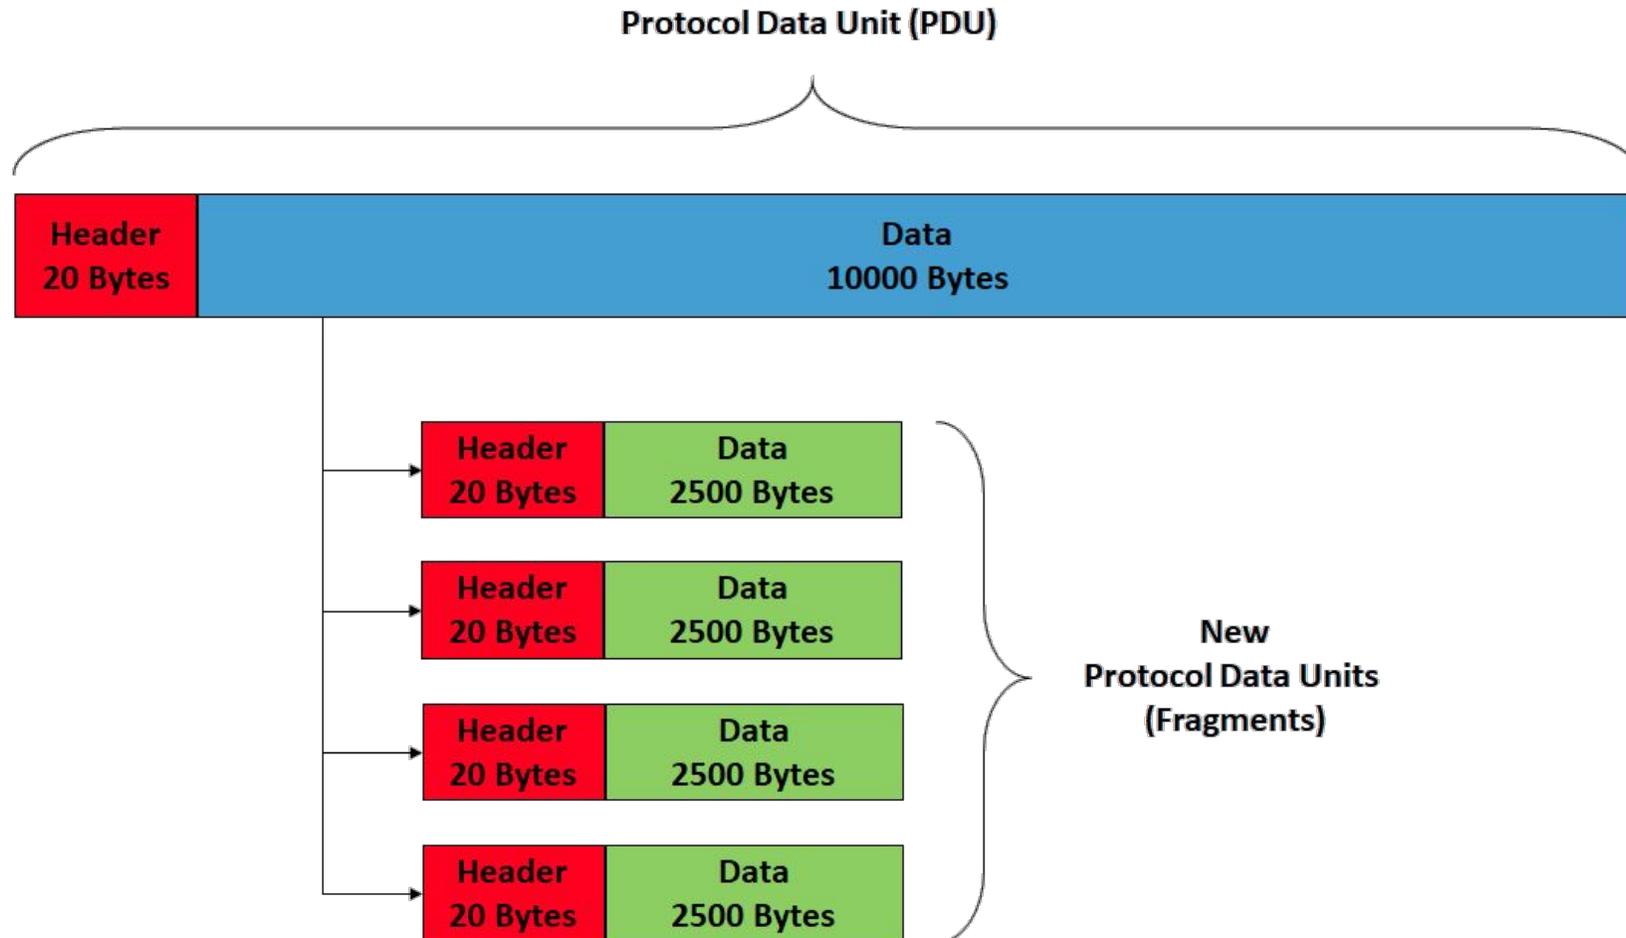

10000001.01010010.10001010.11111110 → 129.82.138.255

Perform logical AND to get the network part = 129.82.138.224

Available addresses - 129.82.138.225-129.82.138.254

Broadcast address - 129.82.138.255

IP Fragmentation and Reassembly

wikipedia

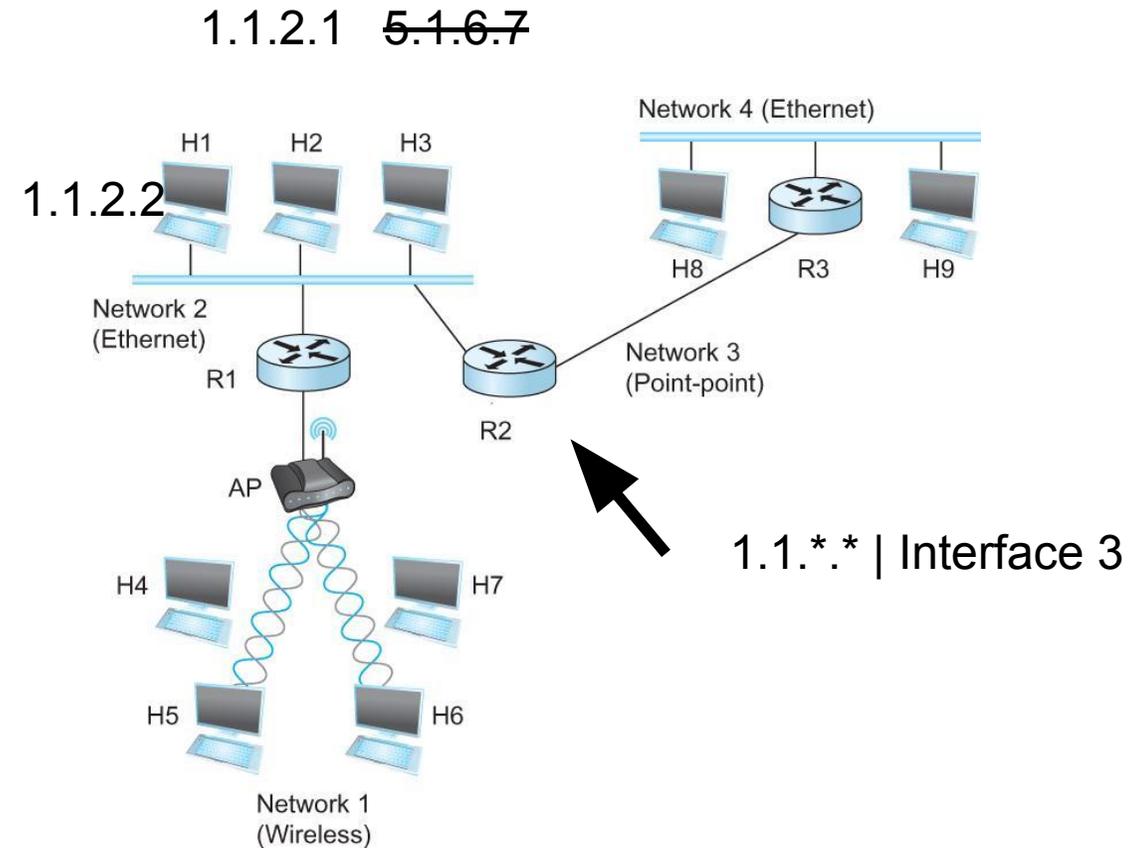

IP addresses are in Network + Host

- 1.1.2.1 →
 - 1.1 → Network part
 - 2.1 → host part
- Each octet can range from 1- 255
- Hierarchical address

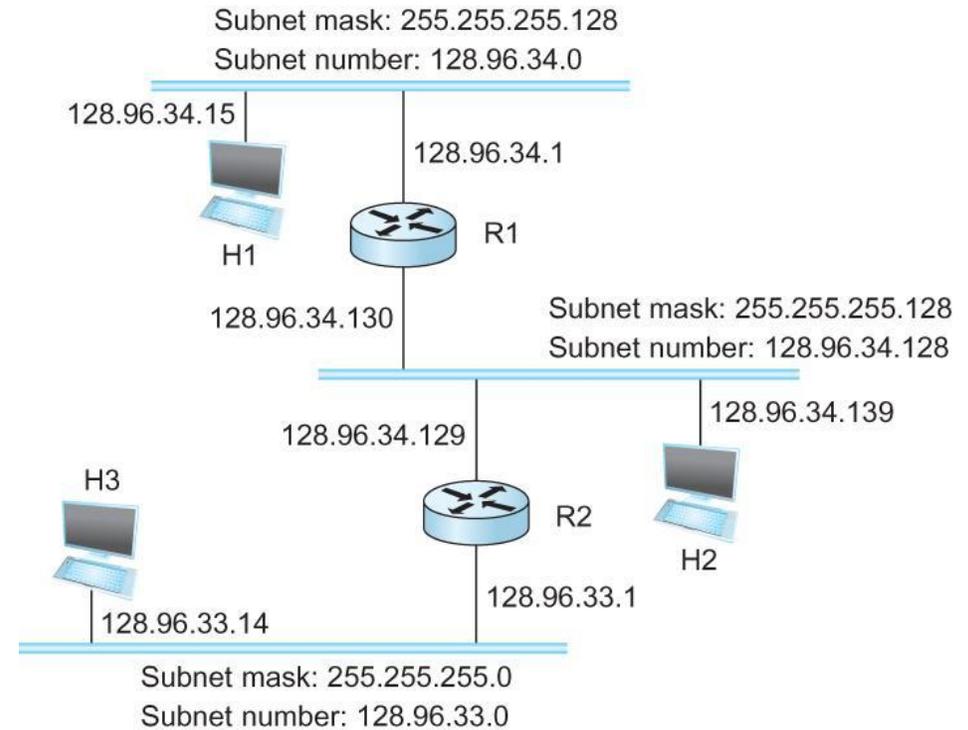

129.82.138.254

10000001.01010010.10001010.11111110

Network part (24 bits). Host part(8 bits)

Subnetting

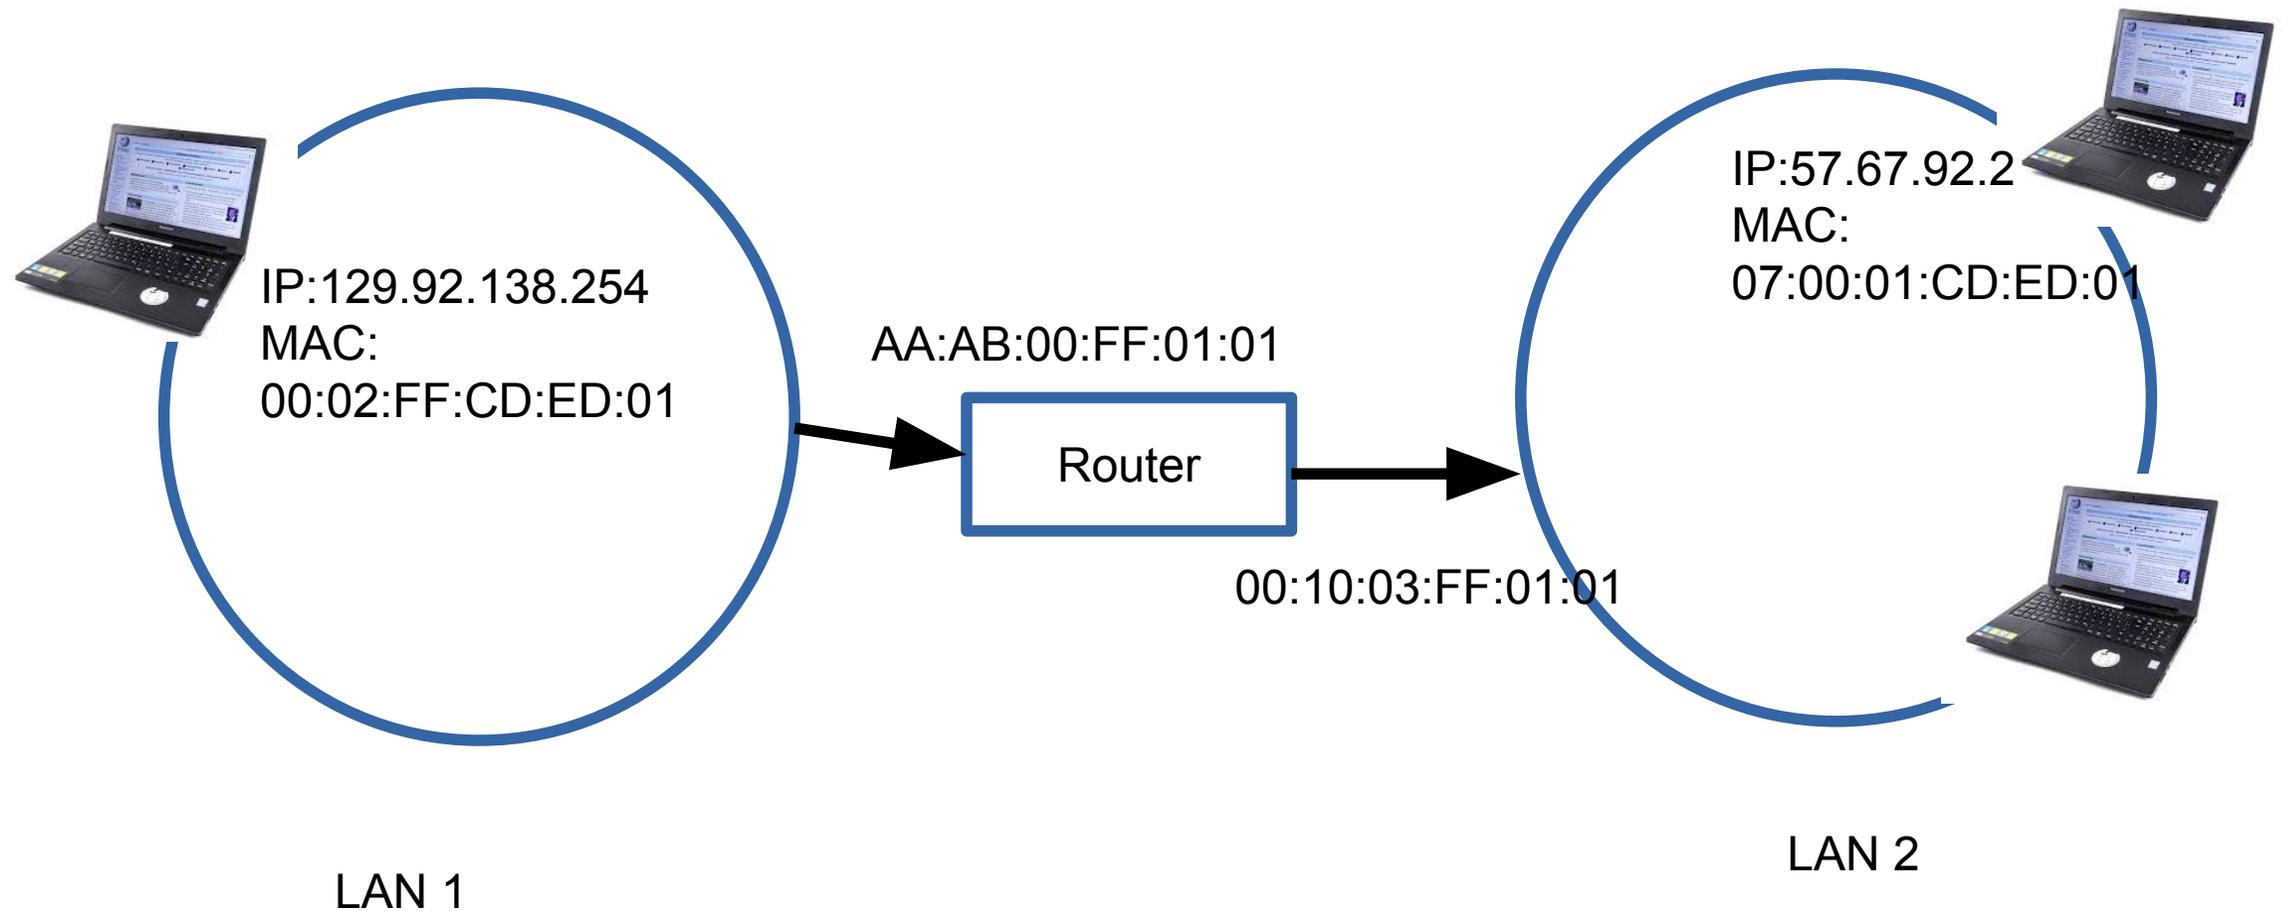

Forwarding Table at Router R1

SubnetNumber	SubnetMask	NextHop
128.96.34.0	255.255.255.128	Interface 0
128.96.34.128	255.255.255.128	Interface 1
128.96.33.0	255.255.255.0	R2

Now let's map that to MAC address

- Adaptors only understand MAC addresses
- Source: 129.82.138.254, Destination: 129.82.138.5
- Your machine does not know what that means:
 - Routers for getting you to the room
 - In the room, you still need to use the MAC address
- Put IP packet in a frame → **Encapsulation**

IP ↔ MAC mapping: Address Resolution Protocol (ARP)

IP ↔ MAC mapping: Address Resolution Protocol (ARP)

- Important concept → Broadcast
 - Shout in the room → Who here is Rachel?

ARP table

- Important concept → Broadcast
- Shout in the room → Who here is Rachel?

Ethernet address for 129.82.138.254?
Send to : FF-FF-FF-FF-FF-FF
Everyone receives it!!

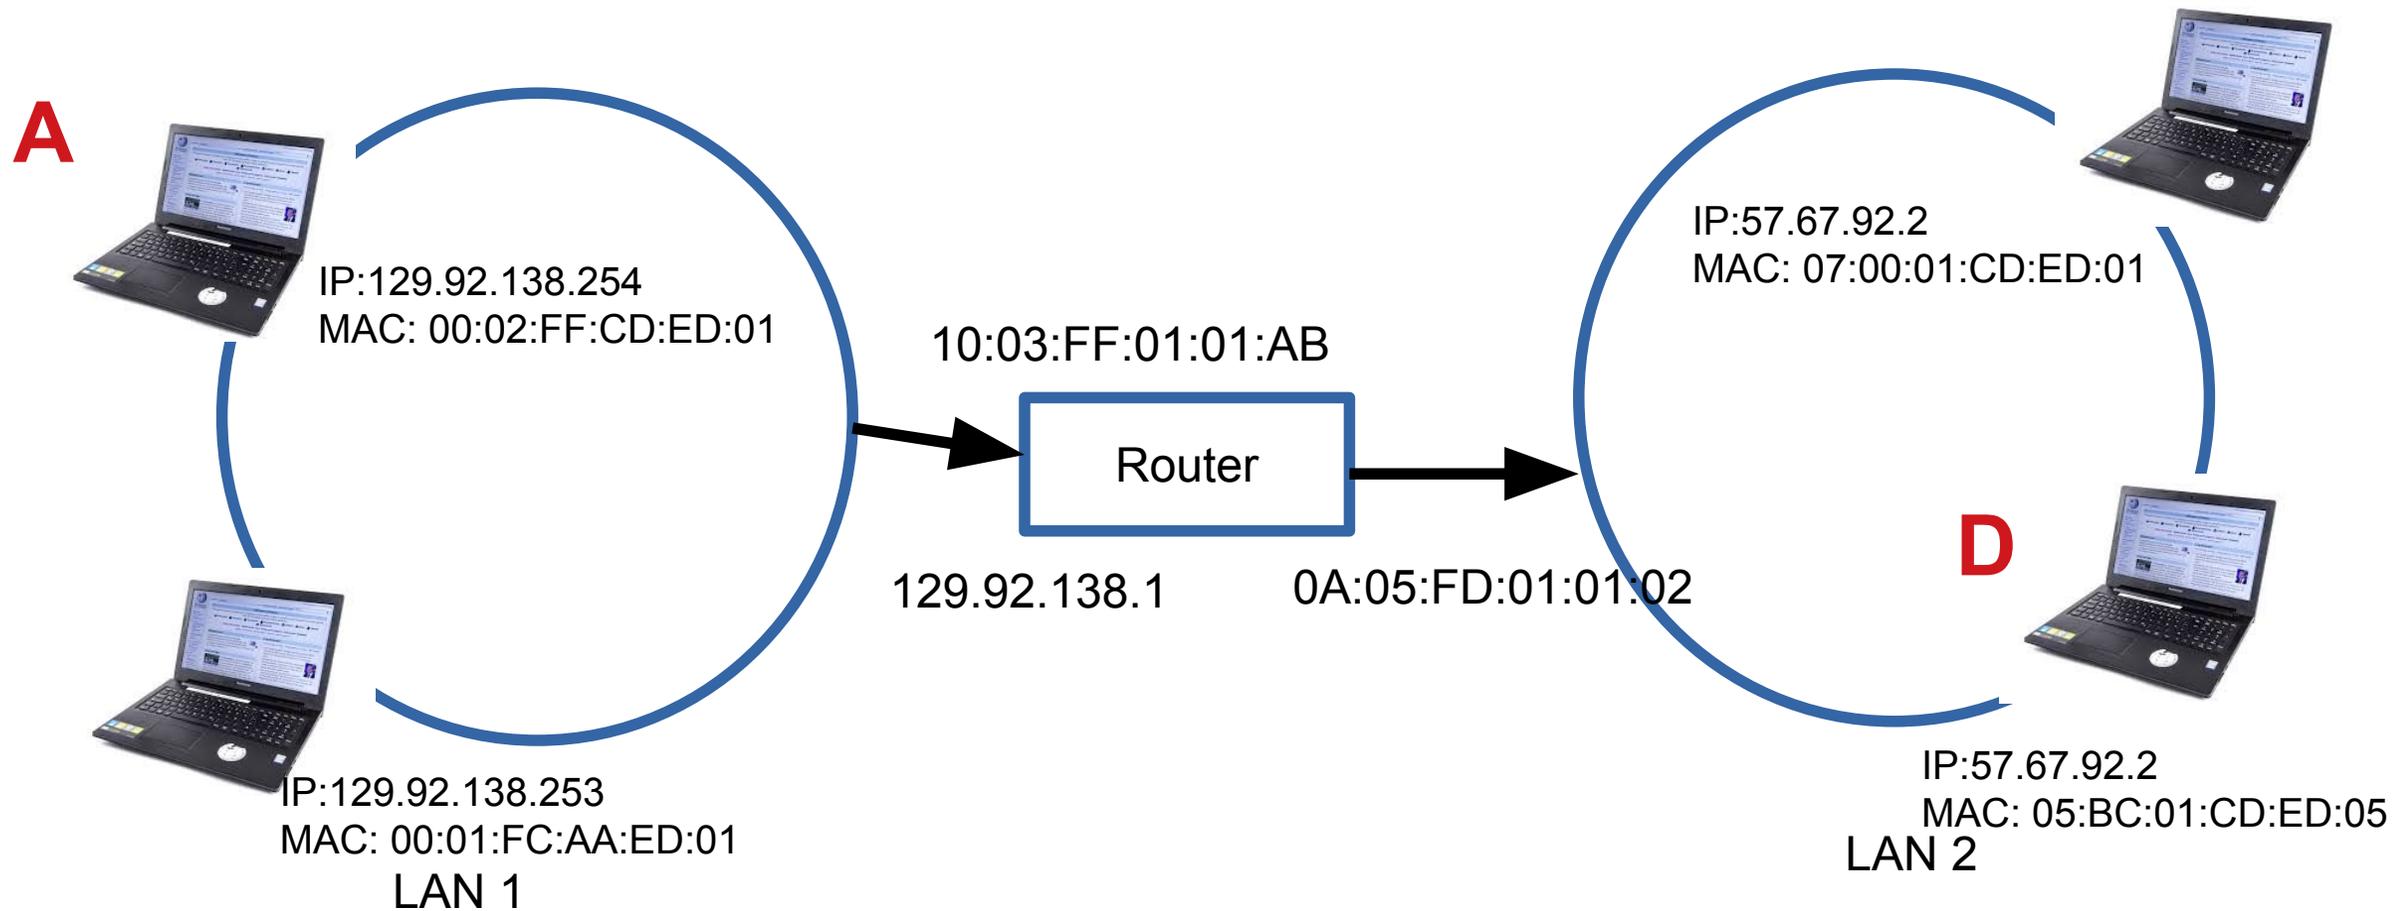

It's me, my MAC is 00:00:22:33:01:21

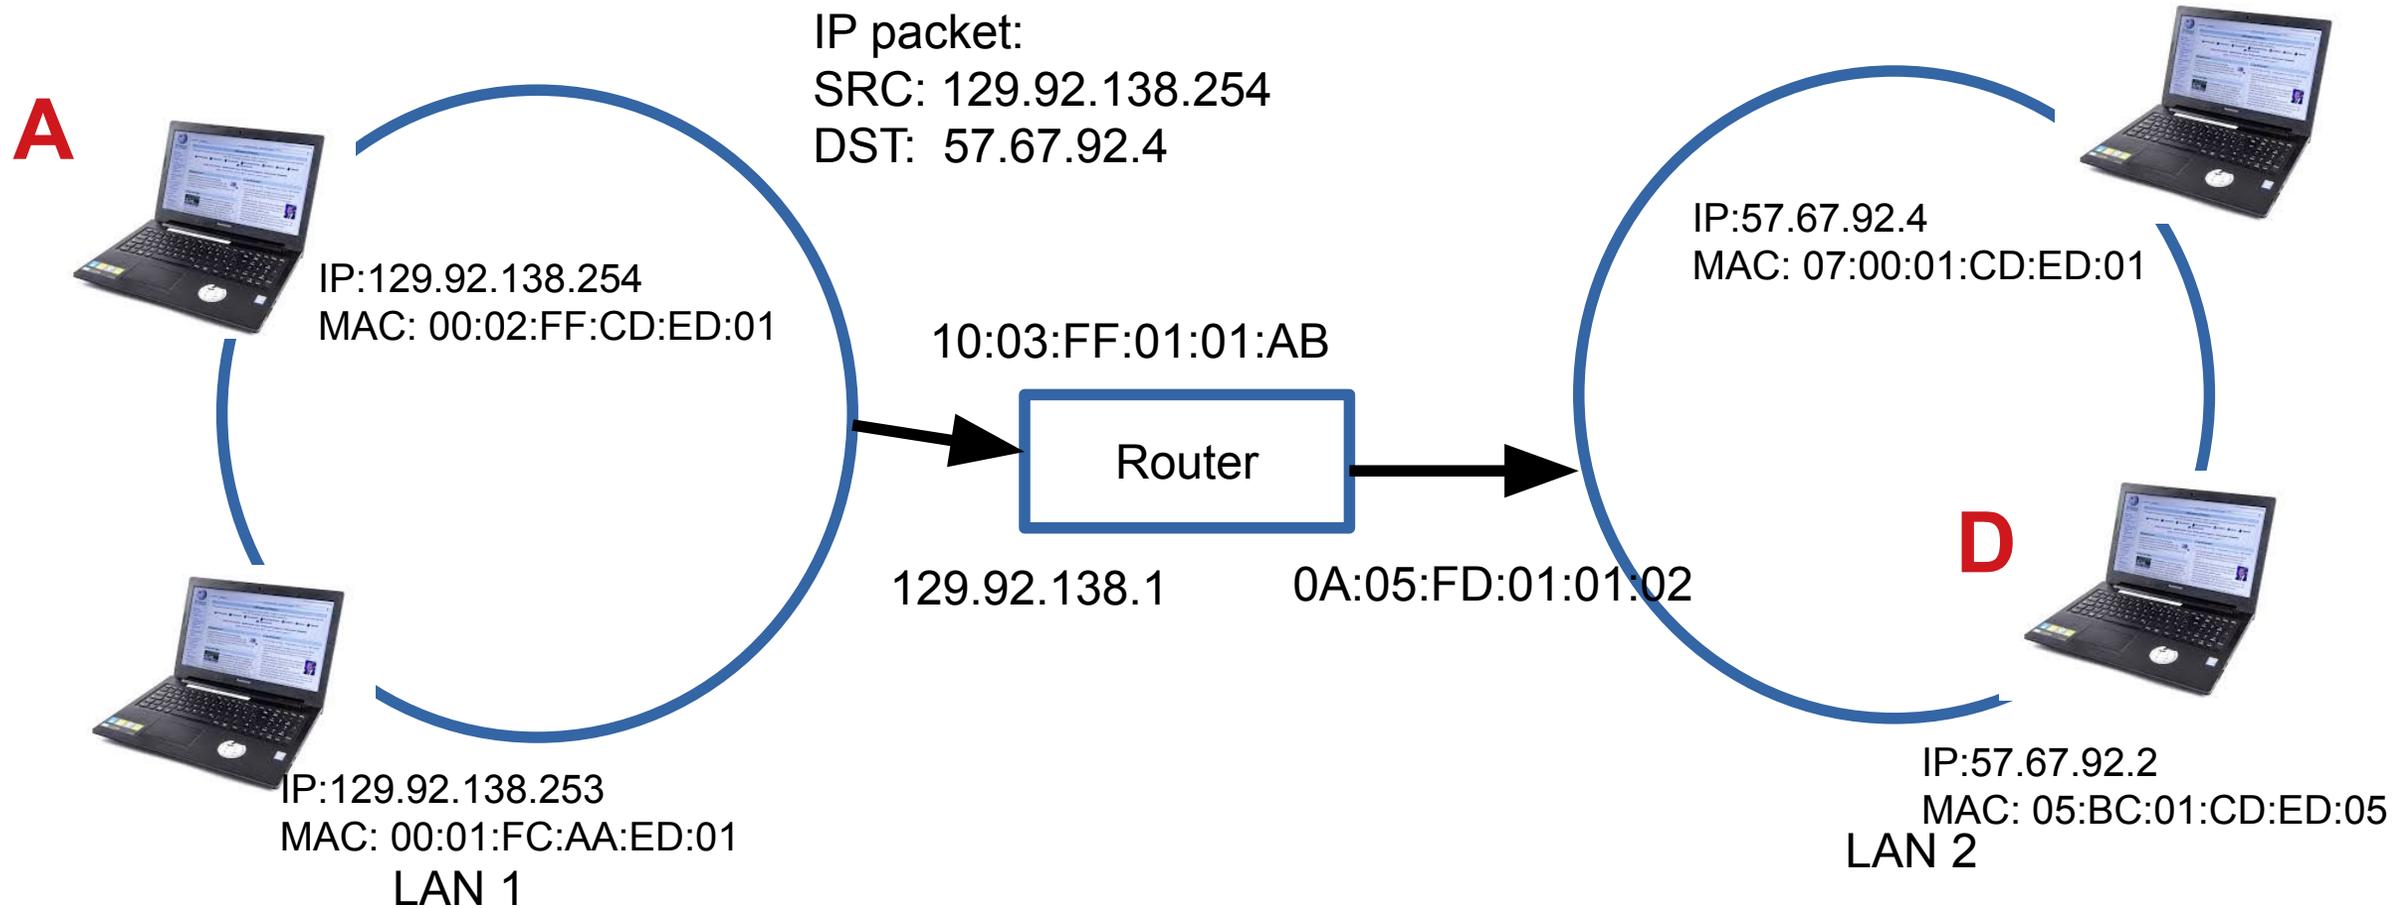

IP ↔ MAC mapping: Address Resolution Protocol (ARP)

- Every node maintains an ARP table
 - <MAC, IP> mapping
- Consult this table when sending IP packets
- Encapsulate with the MAC address, send it the address
- If address is not known, broadcast!
- Cache the response for some time, and eventually forget
 - **Why not broadcast the IP packet?**

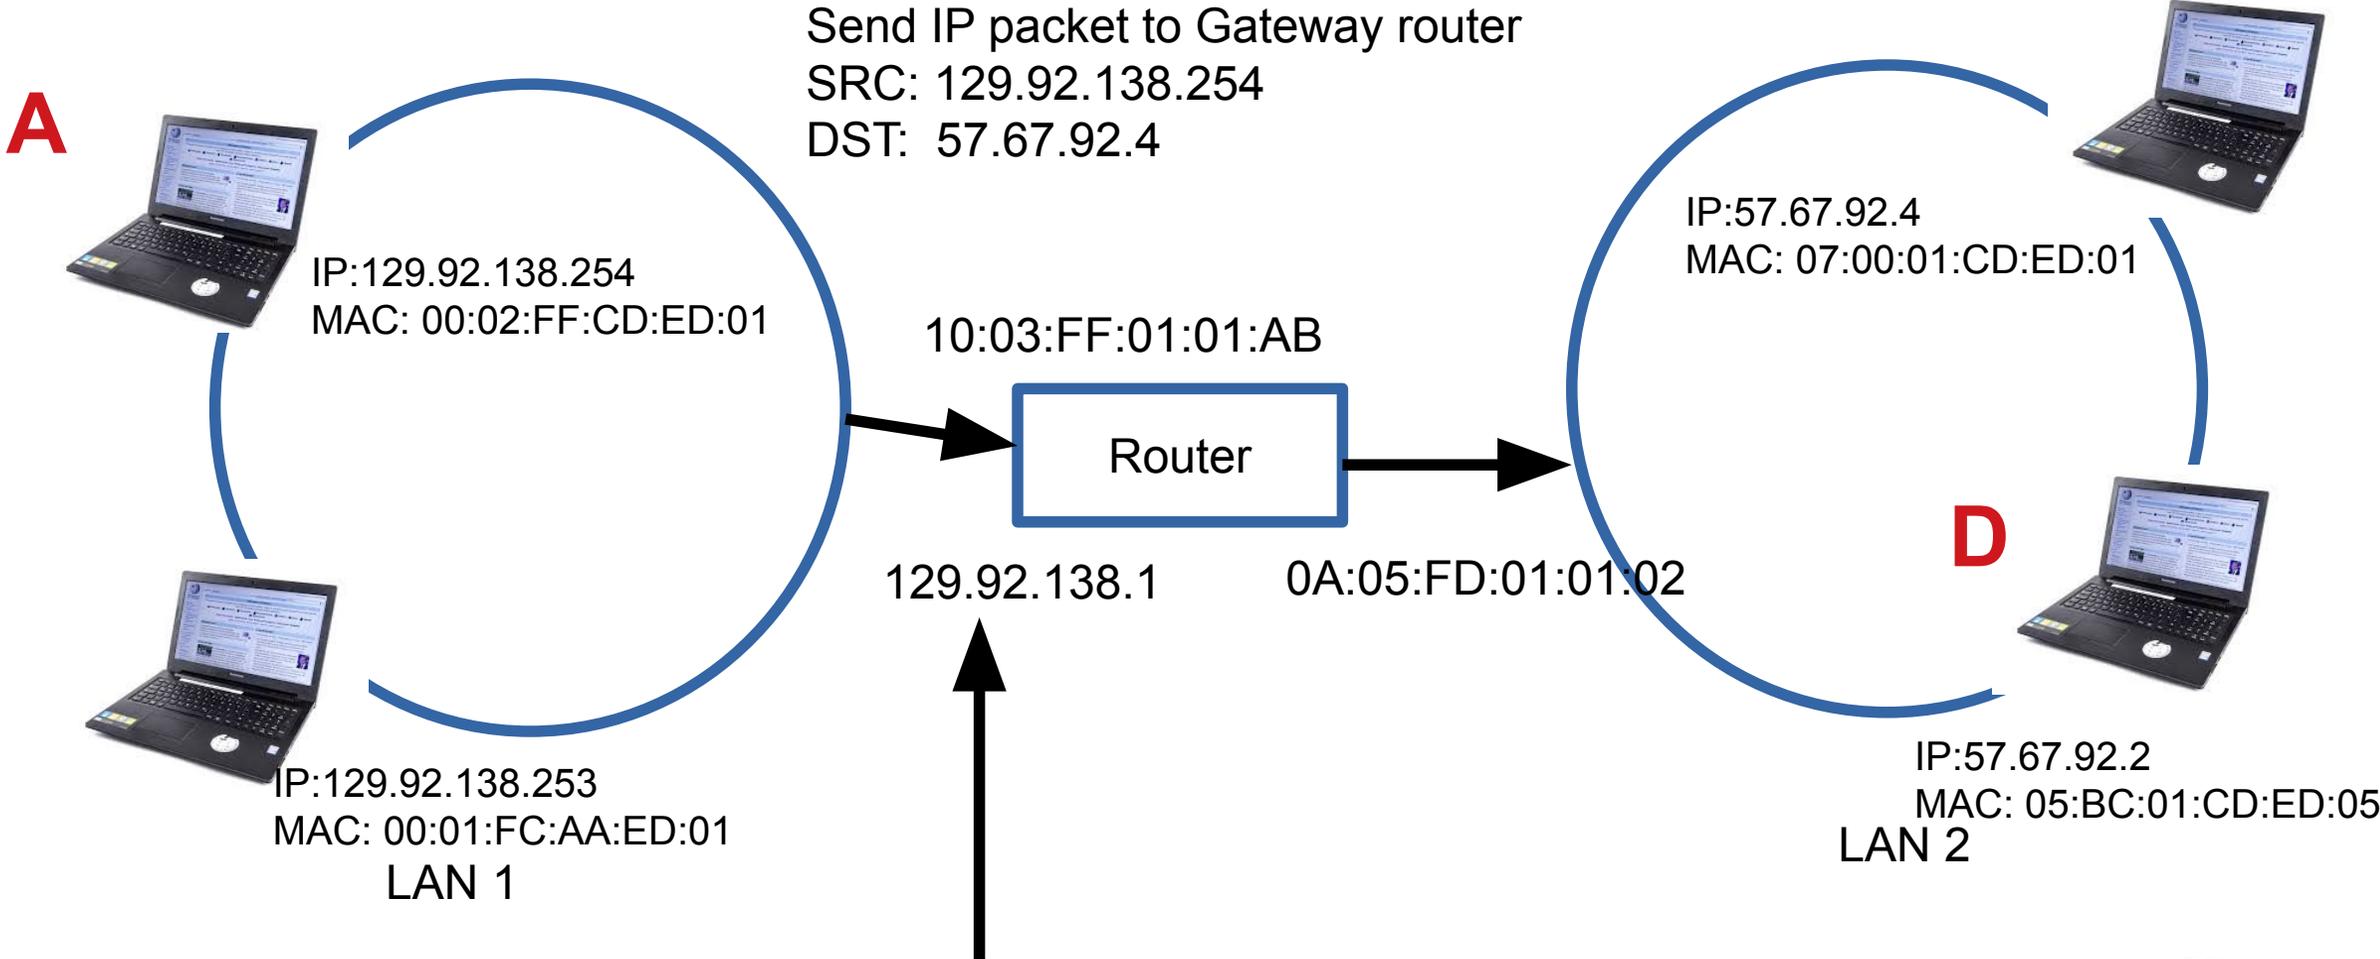

How does A talk to D?

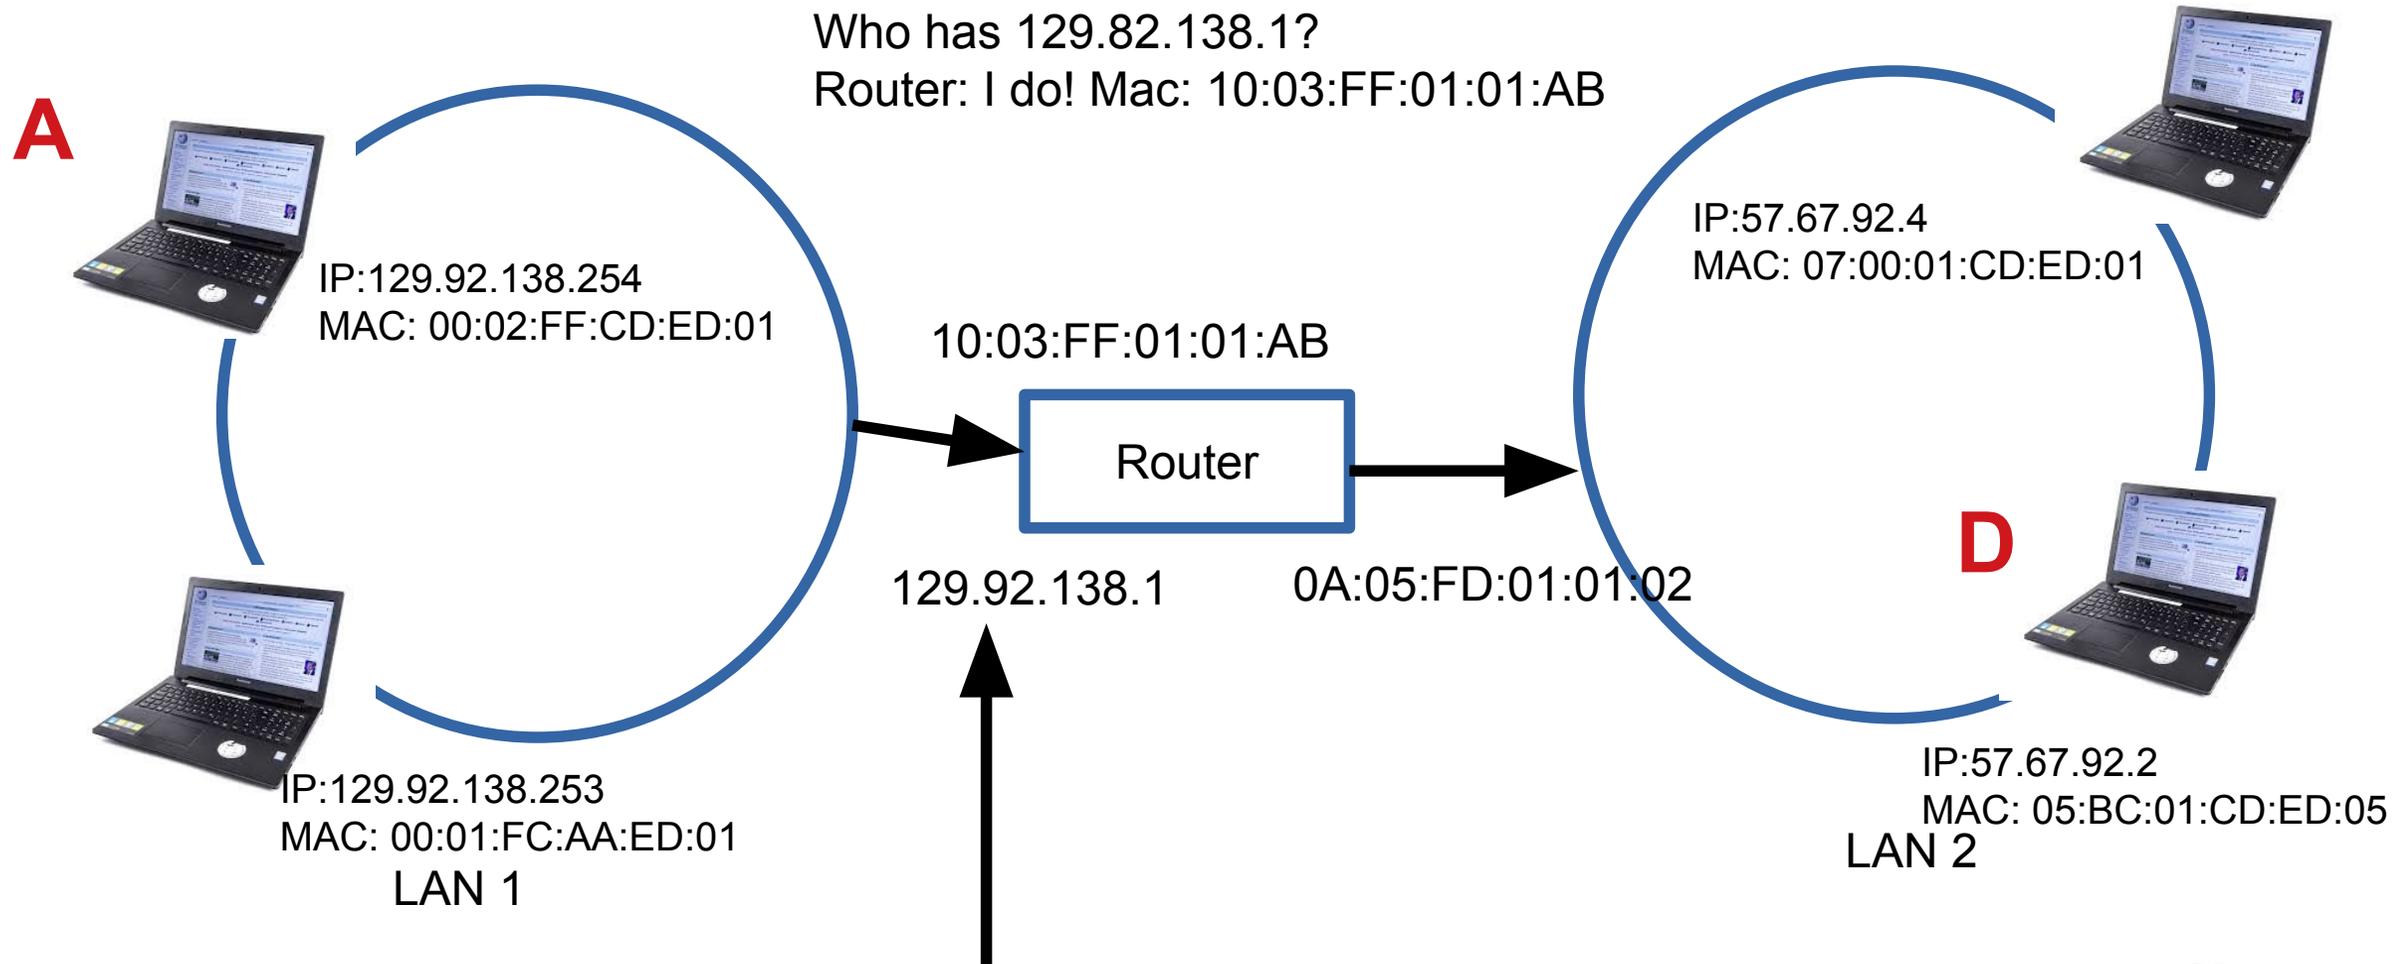

How does A talk to D?

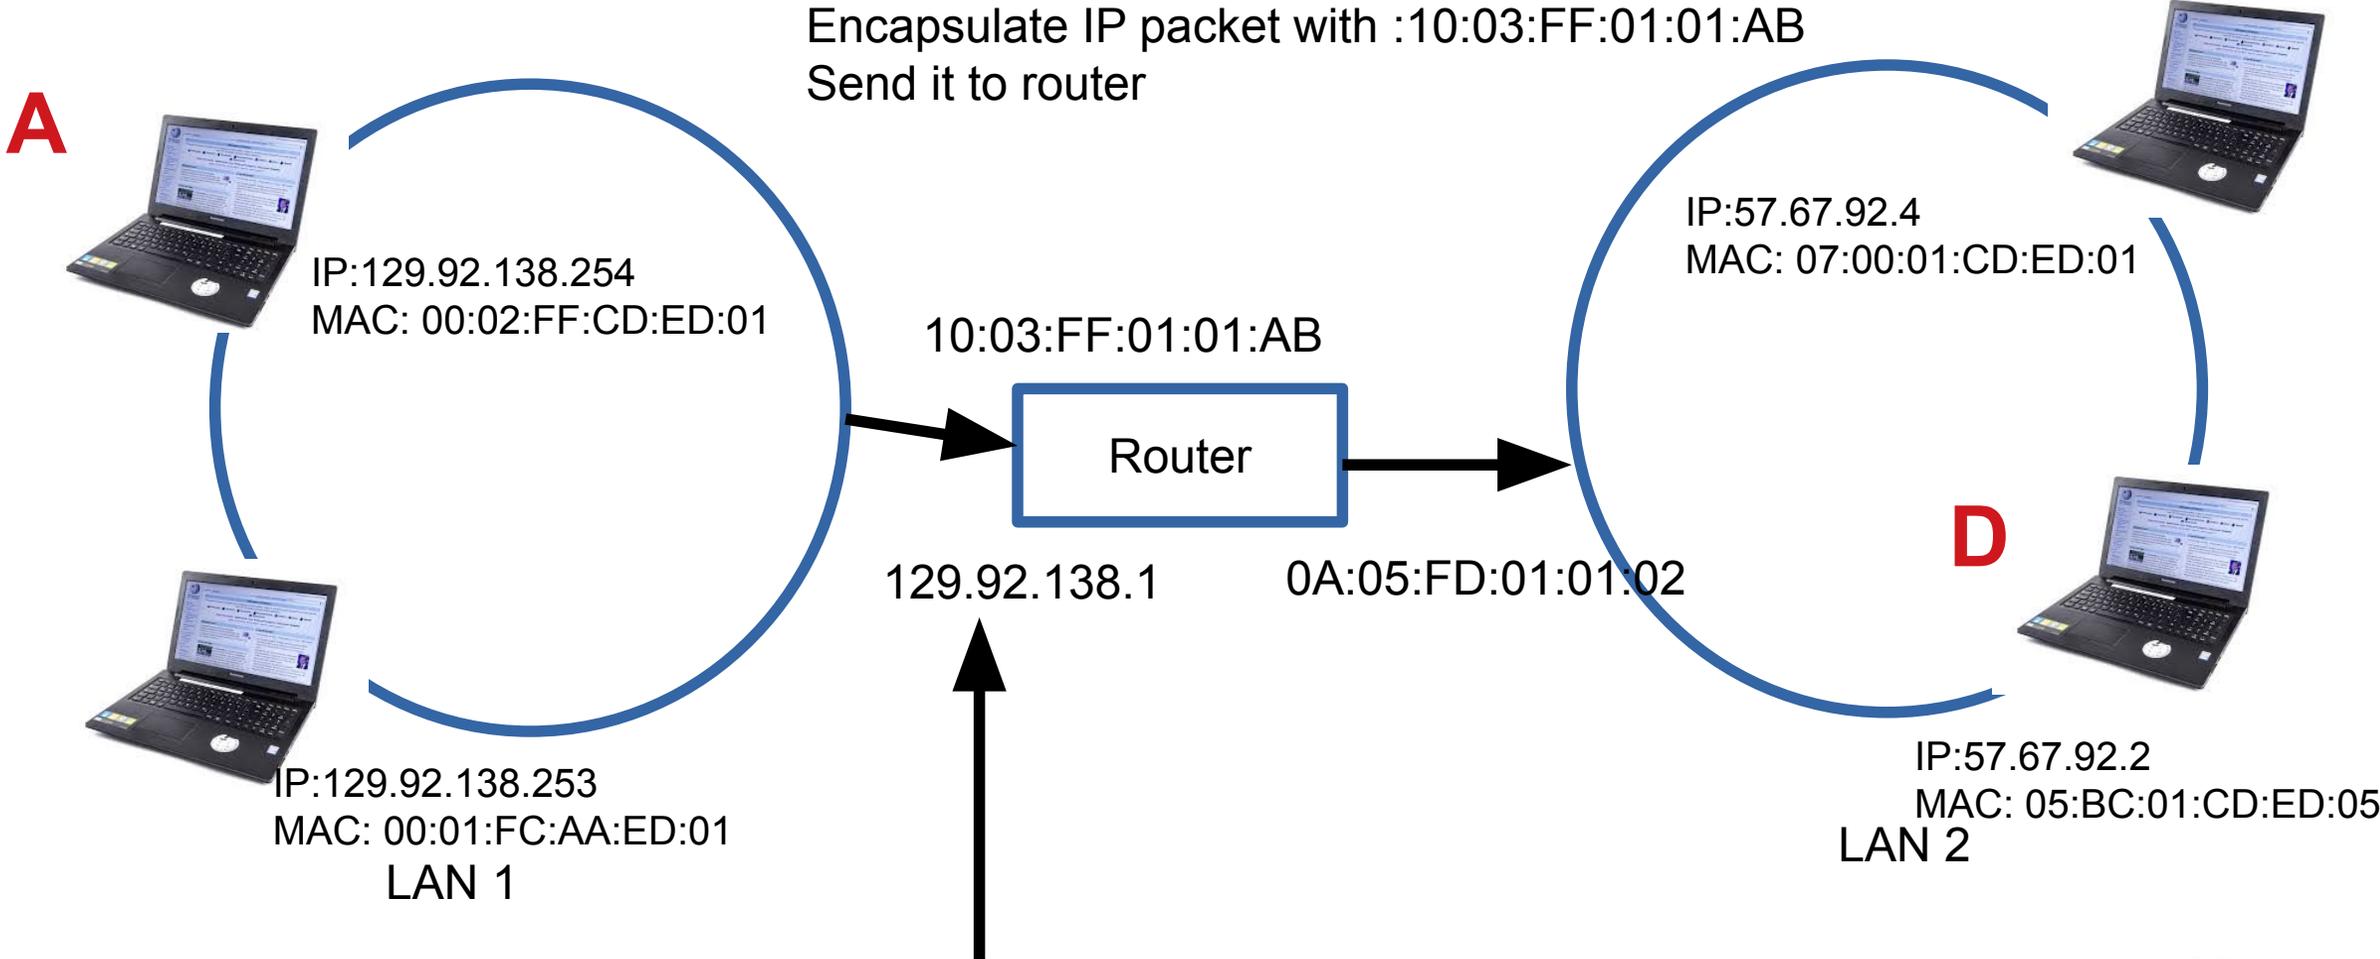

How does A talk to D?

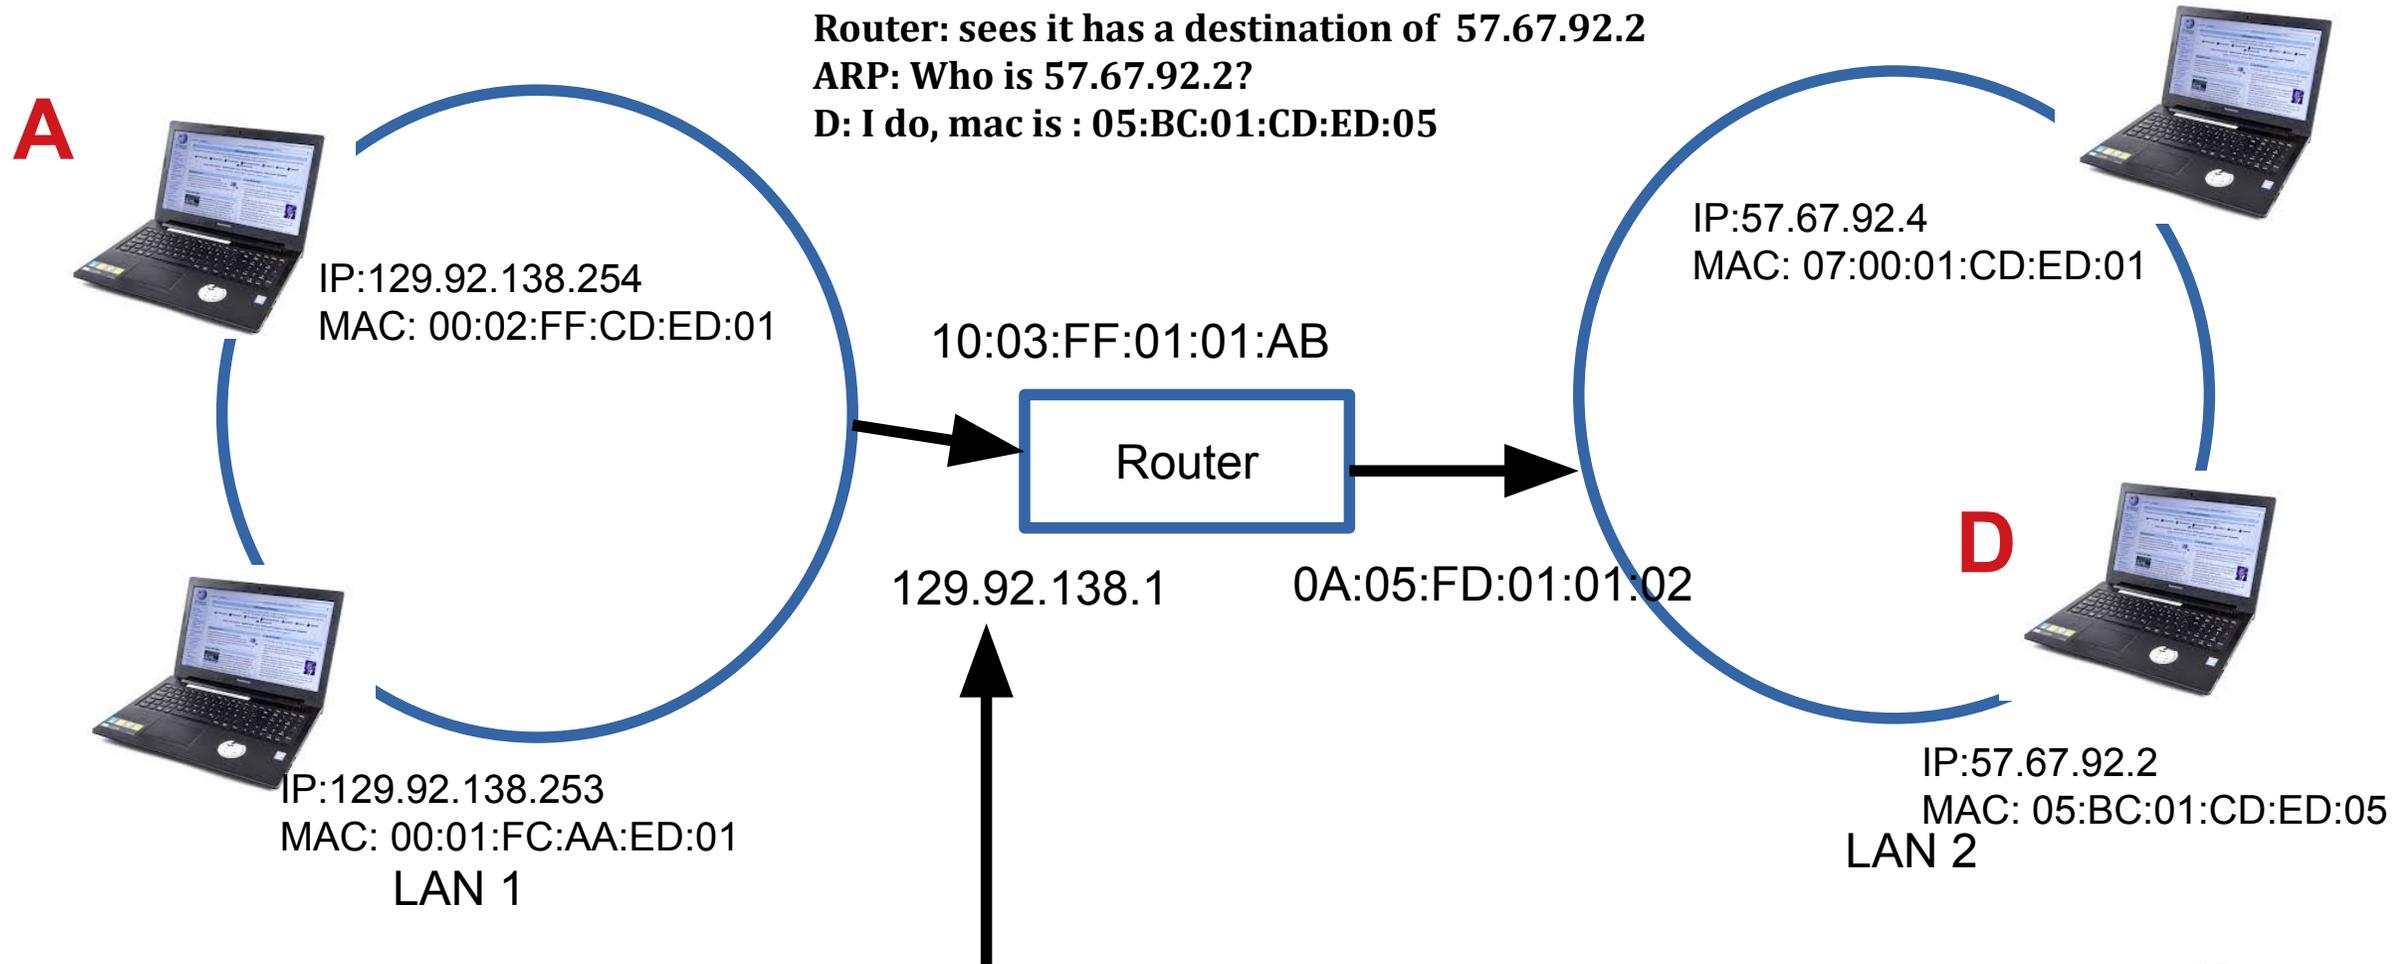

How does A talk to D?

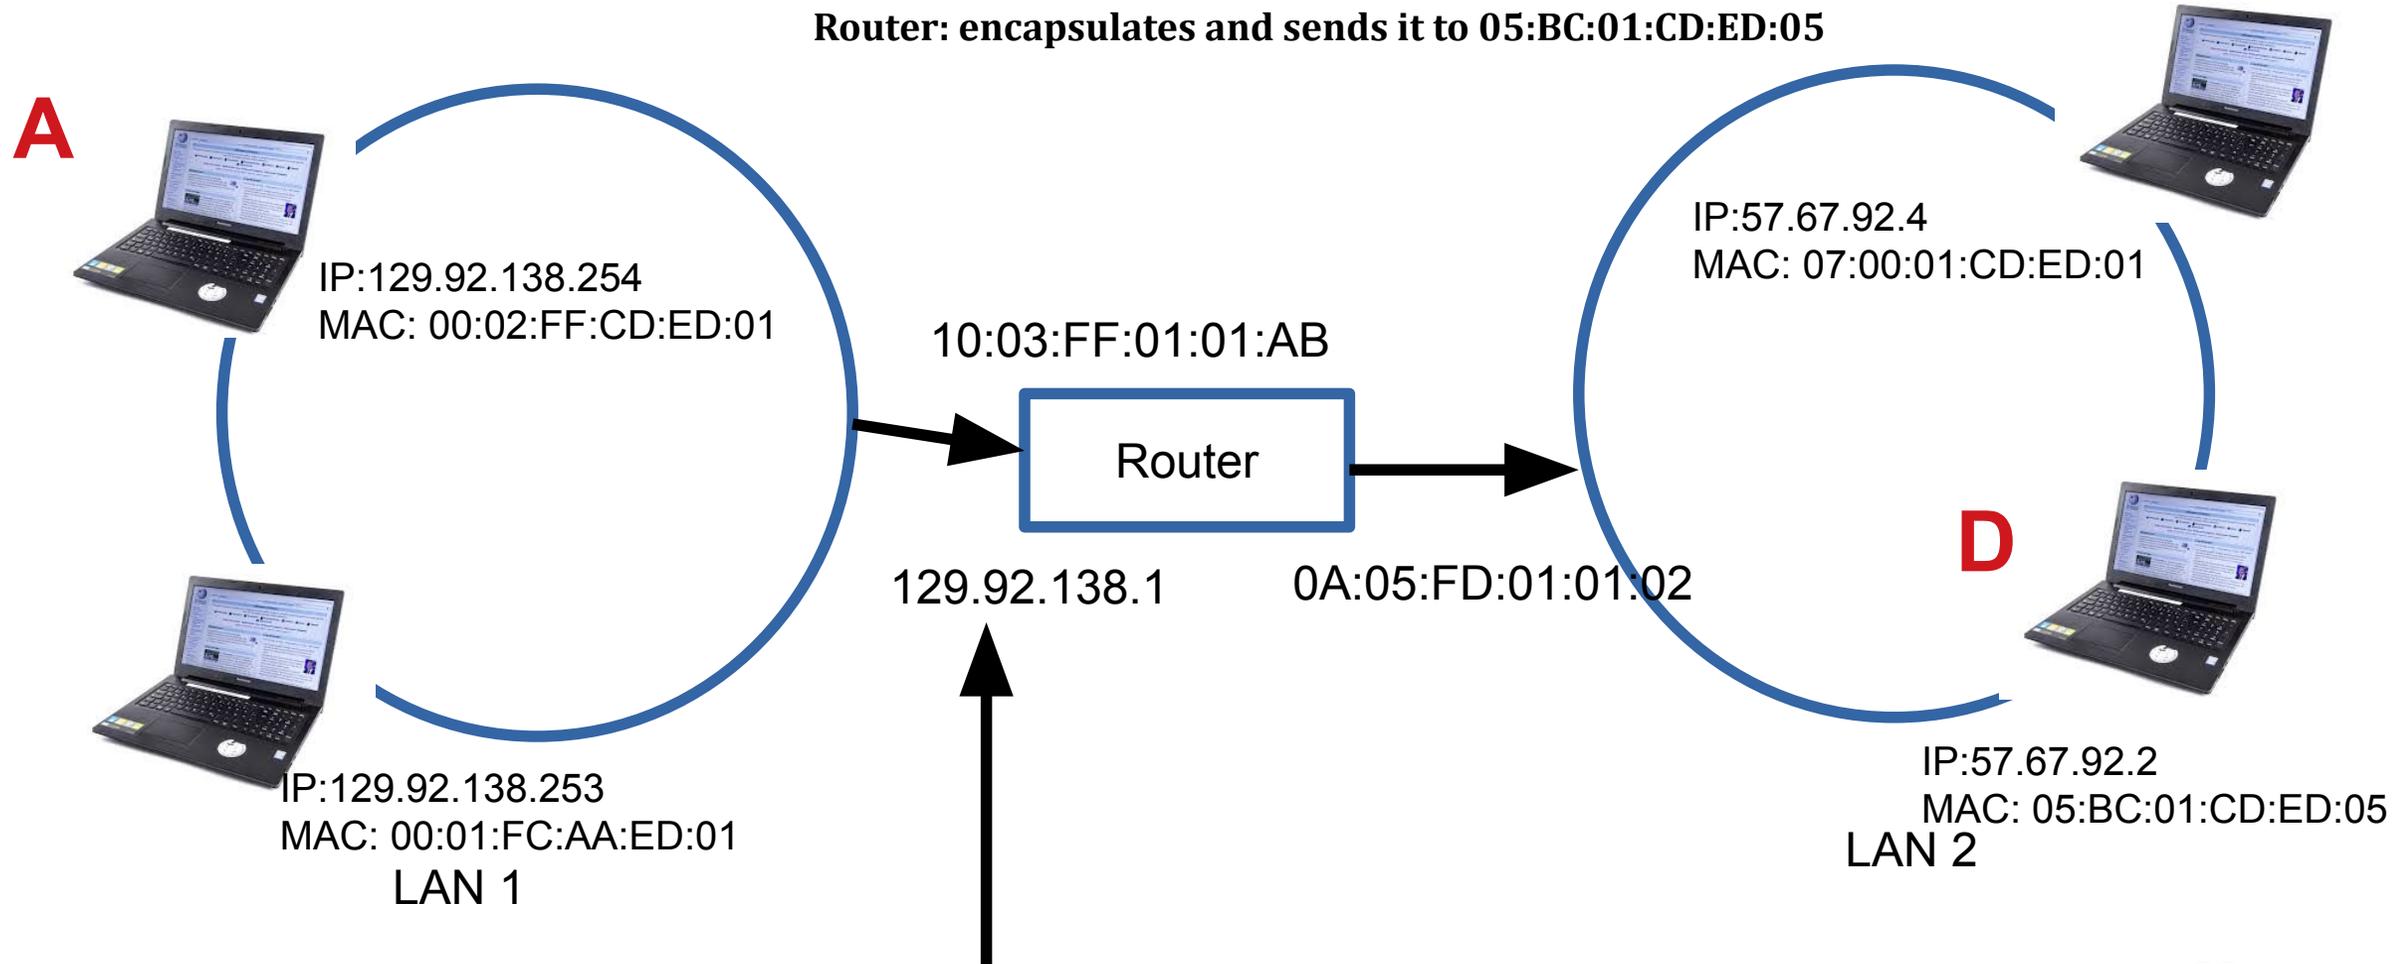

How does A talk to D?

How does A talk to D?

. Subnets Revisited

recipe

- to determine the subnets, detach each interface from its host or router, creating islands of isolated networks
- each isolated network is called a *subnet*

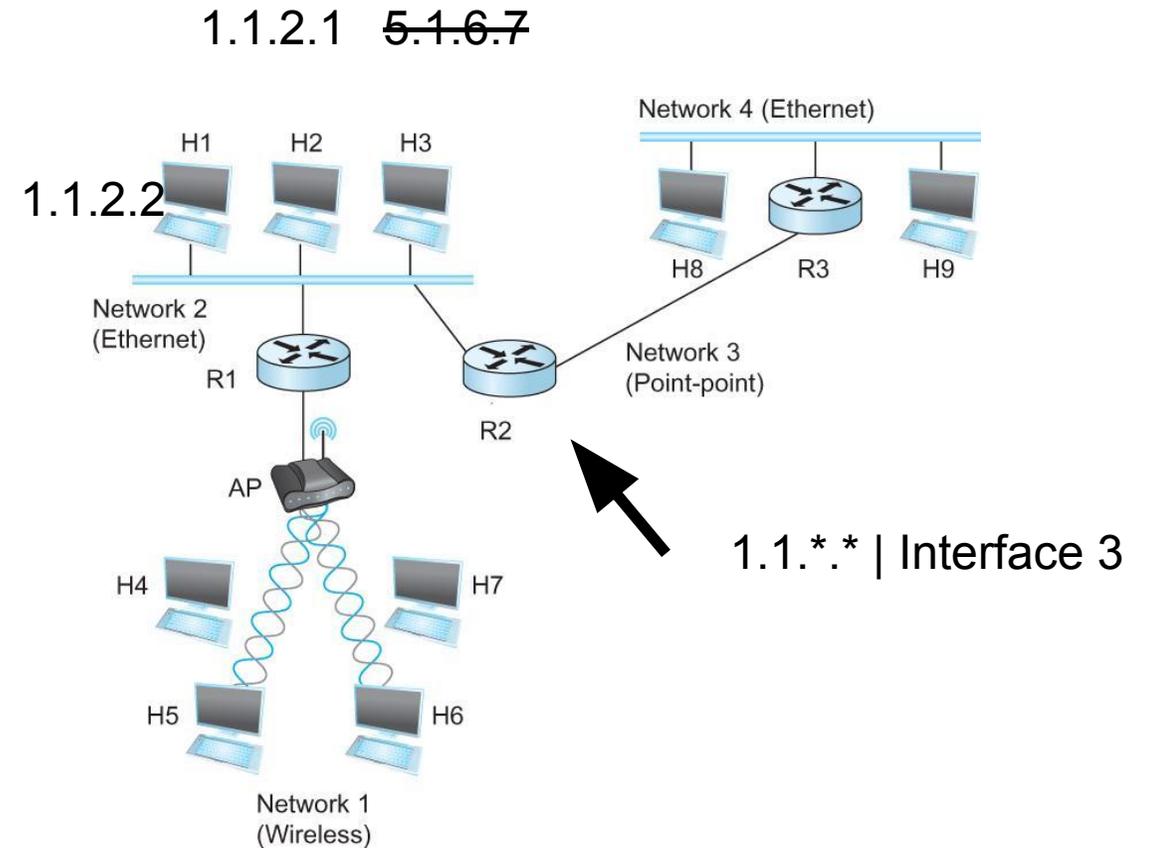

IP addresses are in Network + Host

- 1.1.2.1 →
 - 1.1 → Network part
 - 2.1 → host part
- Each octet can range from 1- 255
- Hierarchical address

129.82.138.254

10000001.01010010.10001010.11111110

Network part (24 bits). Host part(8 bits)

Calculate the first and the last IP address of a subnet

129.82.138.254/27

First host - host bits 0

```
10000001.01010010.10001010.11111110
11111111.11111111.11111111.11100000 (LOGICAL AND)
-----
10000001.01010010.10001010.11100000 → 129.82.138.224
```

Last host - host bits 1

```
10000001.01010010.10001010.11111110
11111111.11111111.11111111.11111111 (LOGICAL AND)
-----
10000001.01010010.10001010.11111110 → 129.82.138.255
```

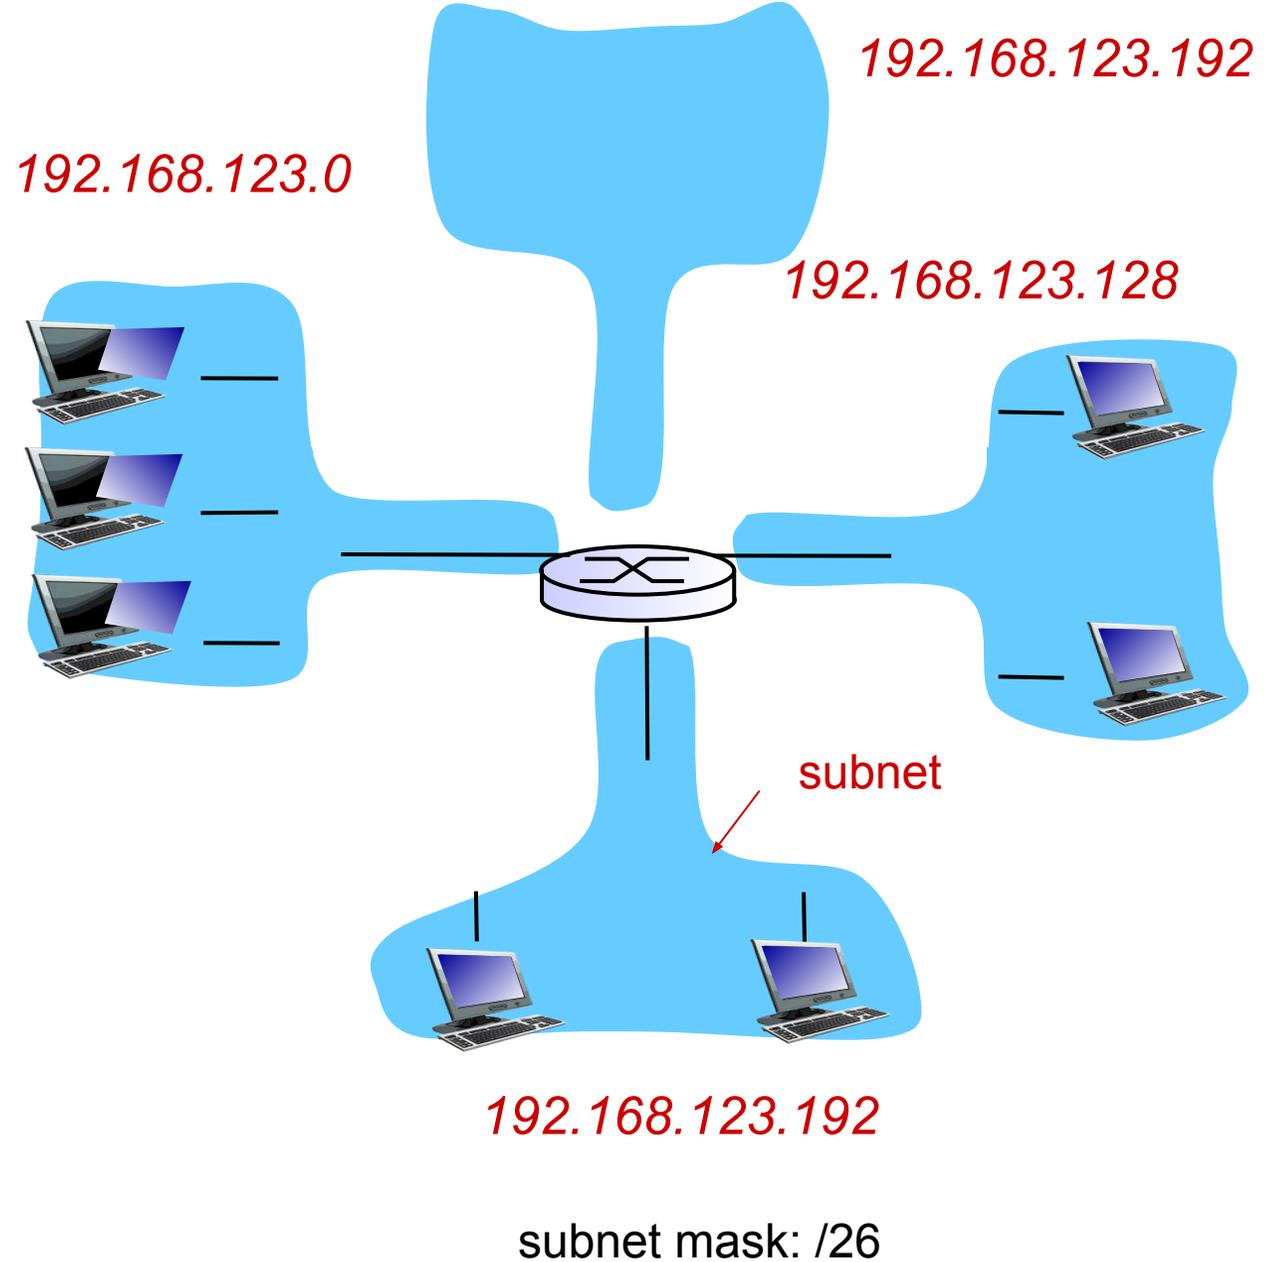

Perform logical AND to get the network part = 129.82.138.224

Available addresses - 129.82.138.225-129.82.138.254

Broadcast address - 129.82.138.255

. Problem

You have
an
address
block:
192.168.123.

DHCP

- **New laptop joins a network**
- Does not have source address
- Does not know who to ask
- Does not know other network parameters like DNS or Gateway router information

DHCP client-server scenario

DHCP server: 223.1.2.5

DHCP discover

Broadcast: is there a DHCP server out there?

arriving client

DHCP offer

Broadcast: I'm a DHCP server!
Here's an IP address you can use

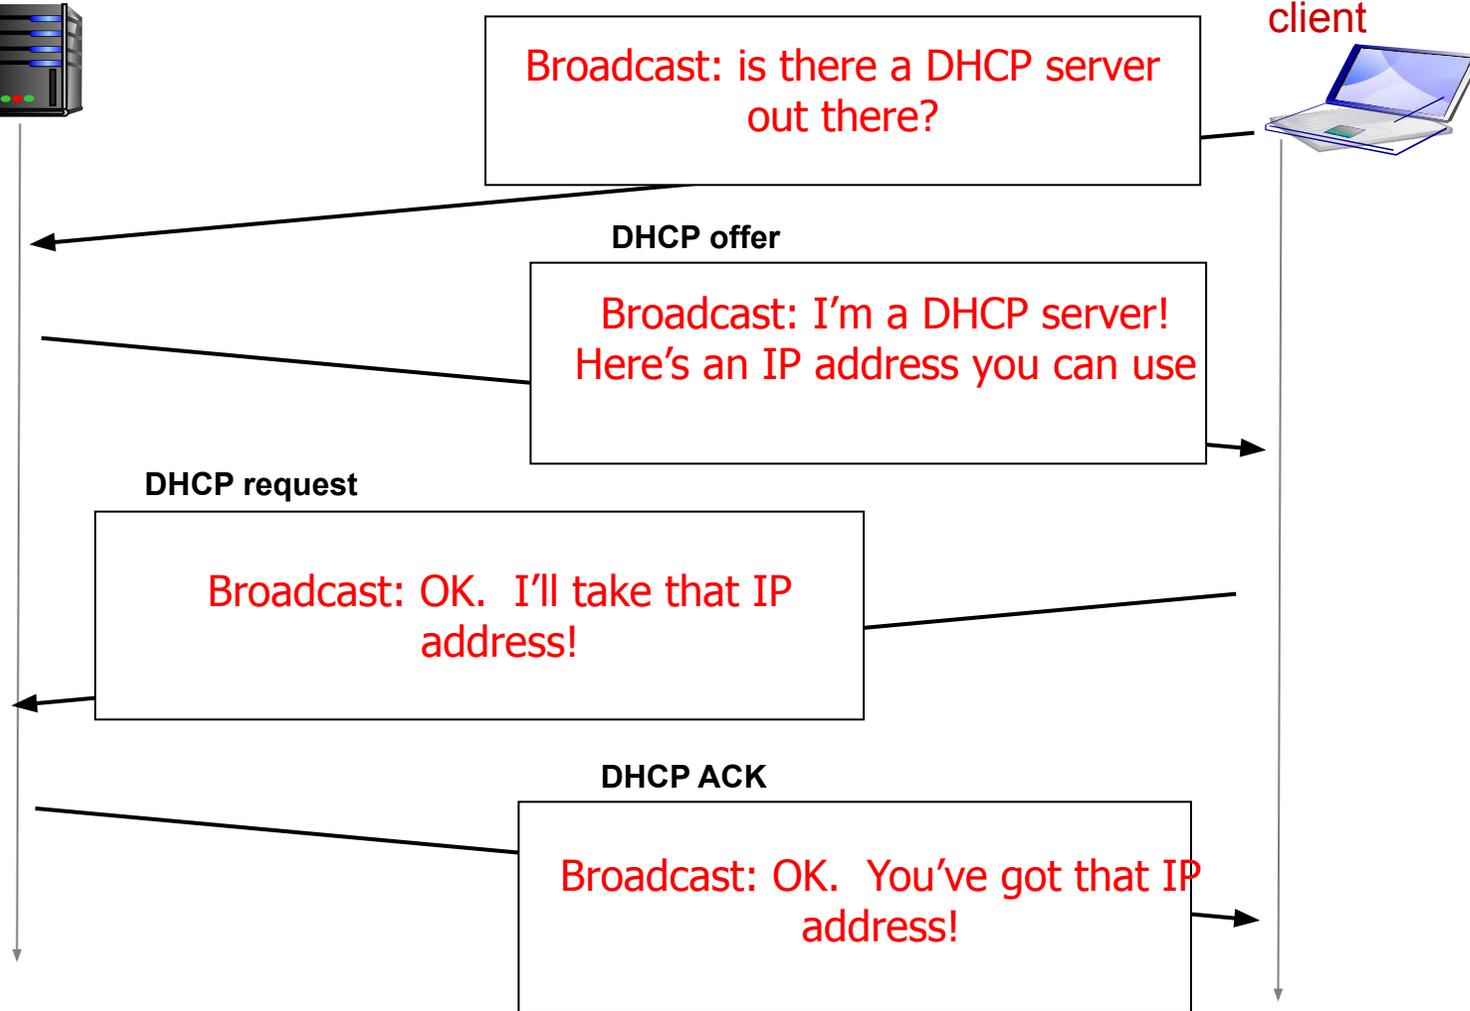

DHCP request

Broadcast: OK. I'll take that IP address!

DHCP ACK

Broadcast: OK. You've got that IP address!

kurose/ross

DHCP Server

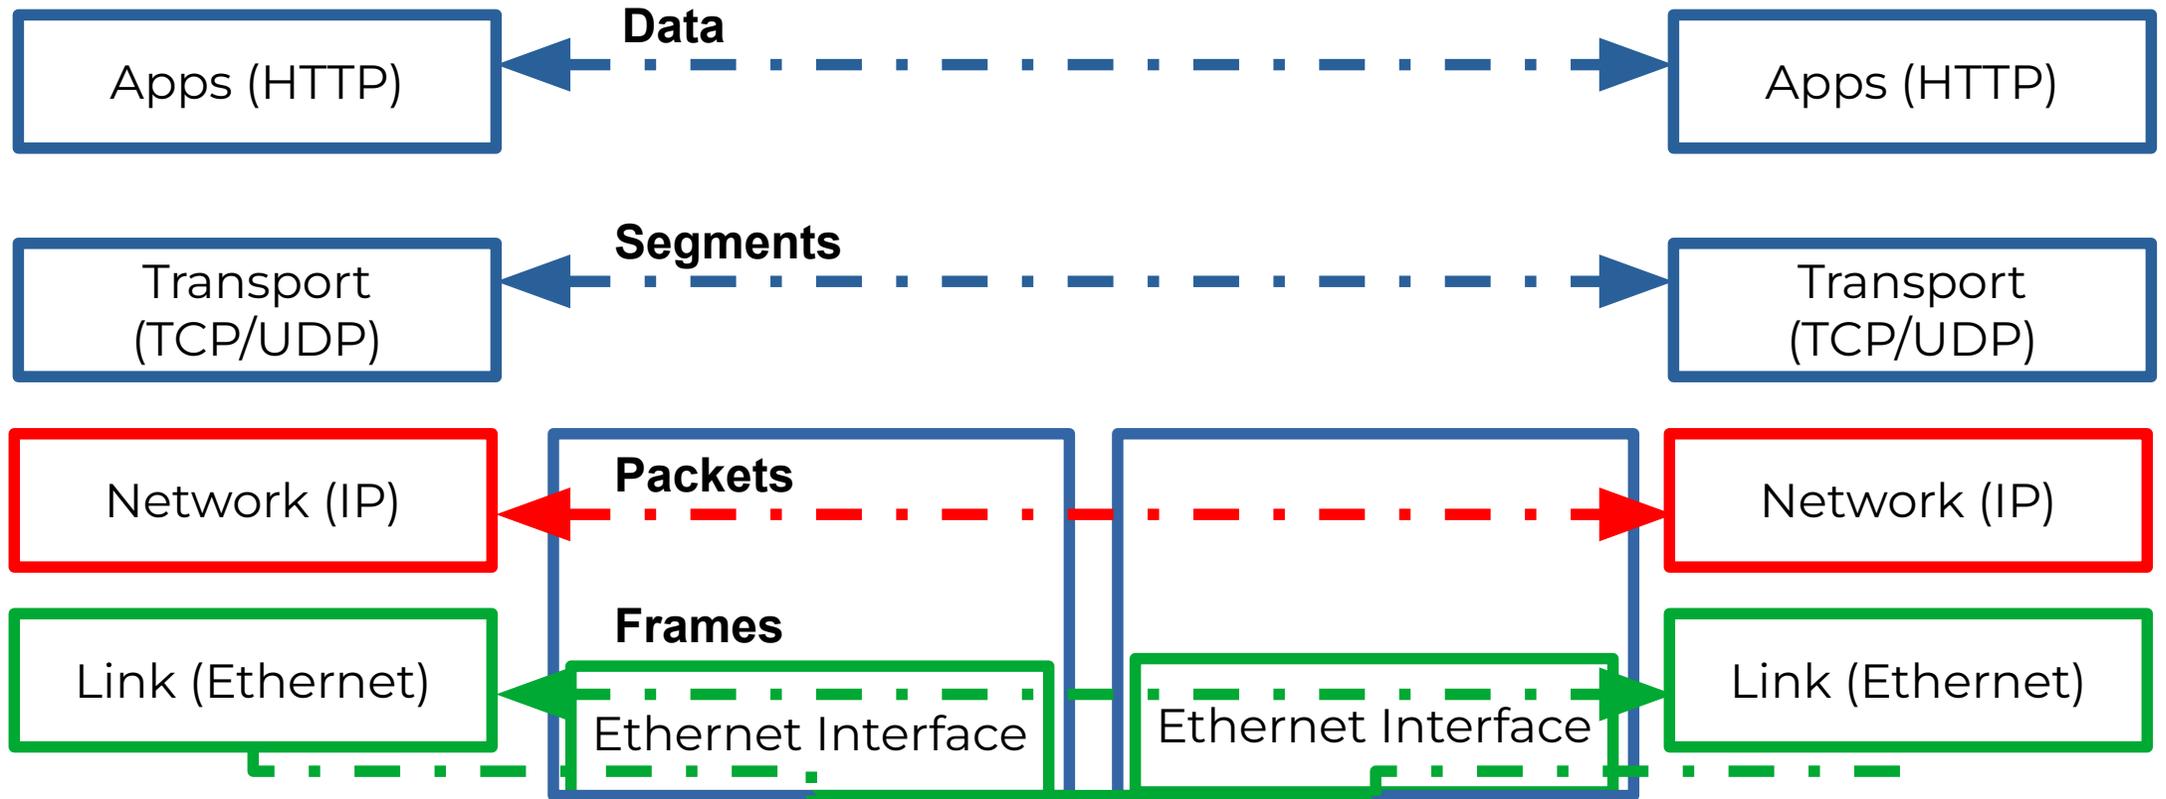

- A local central database with a list of IP addresses
- 10.0.0.1/8
- Offers an available IP to a client for a period of time
- Lease time – 24 hours, 1 hour, configurable ← **Soft State**
- Multiple servers might coexist and offer IP to the same request
- Broadcast medium
- Client decides which one to accept
-

DHCP Client – Keep refreshing!

- IP address provided expires after time ***t***
- Client can release DHCP lease
- Shutdown the laptop
- If you walk away from the building
- Crash
- Performance trade off
- Short time – too many broadcasts, quick recovery of addresses
- Long time – less network traffic, longer recovery of addresses

. Reading Assignment

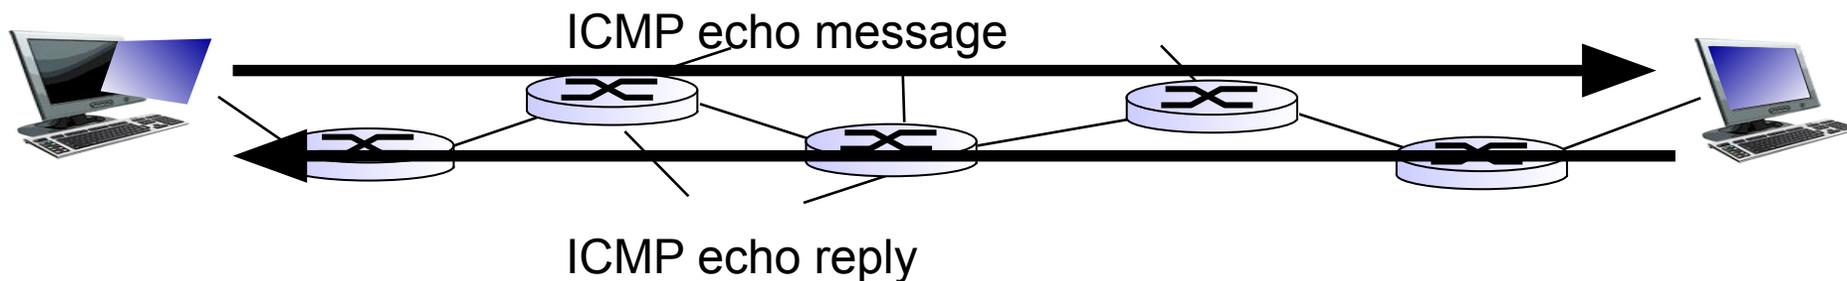

- 
- ARP
 - Chapter 3.2.6
 - DHCP
 - Chapter 3.2.7

Bits (1010001)

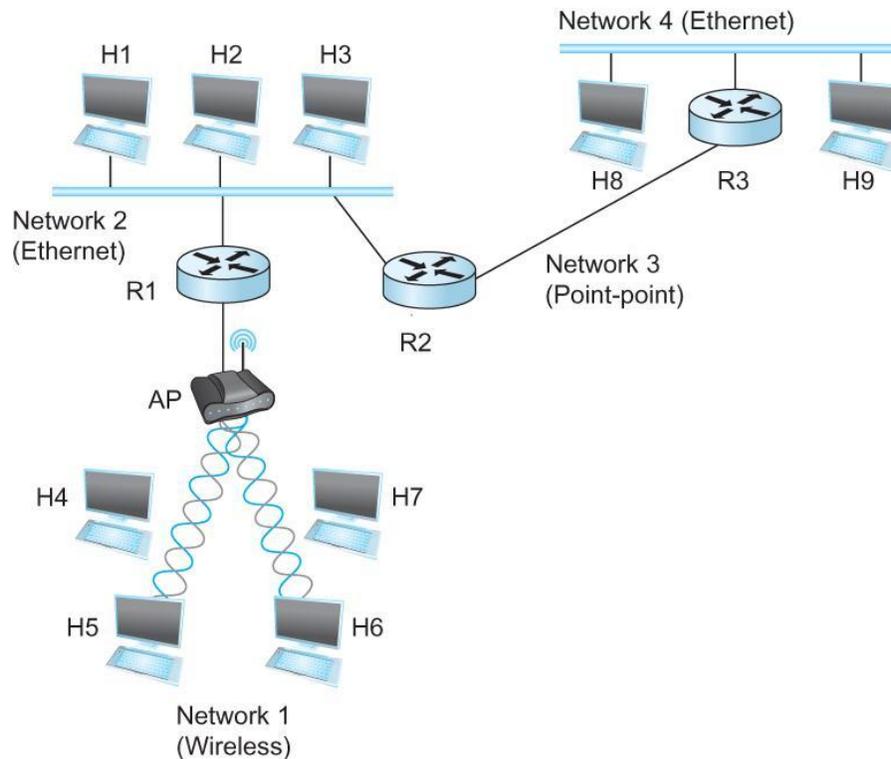

• Ping and ICMP

- source sends an ICMP echo message
- Destination sends an ICMP echo reply

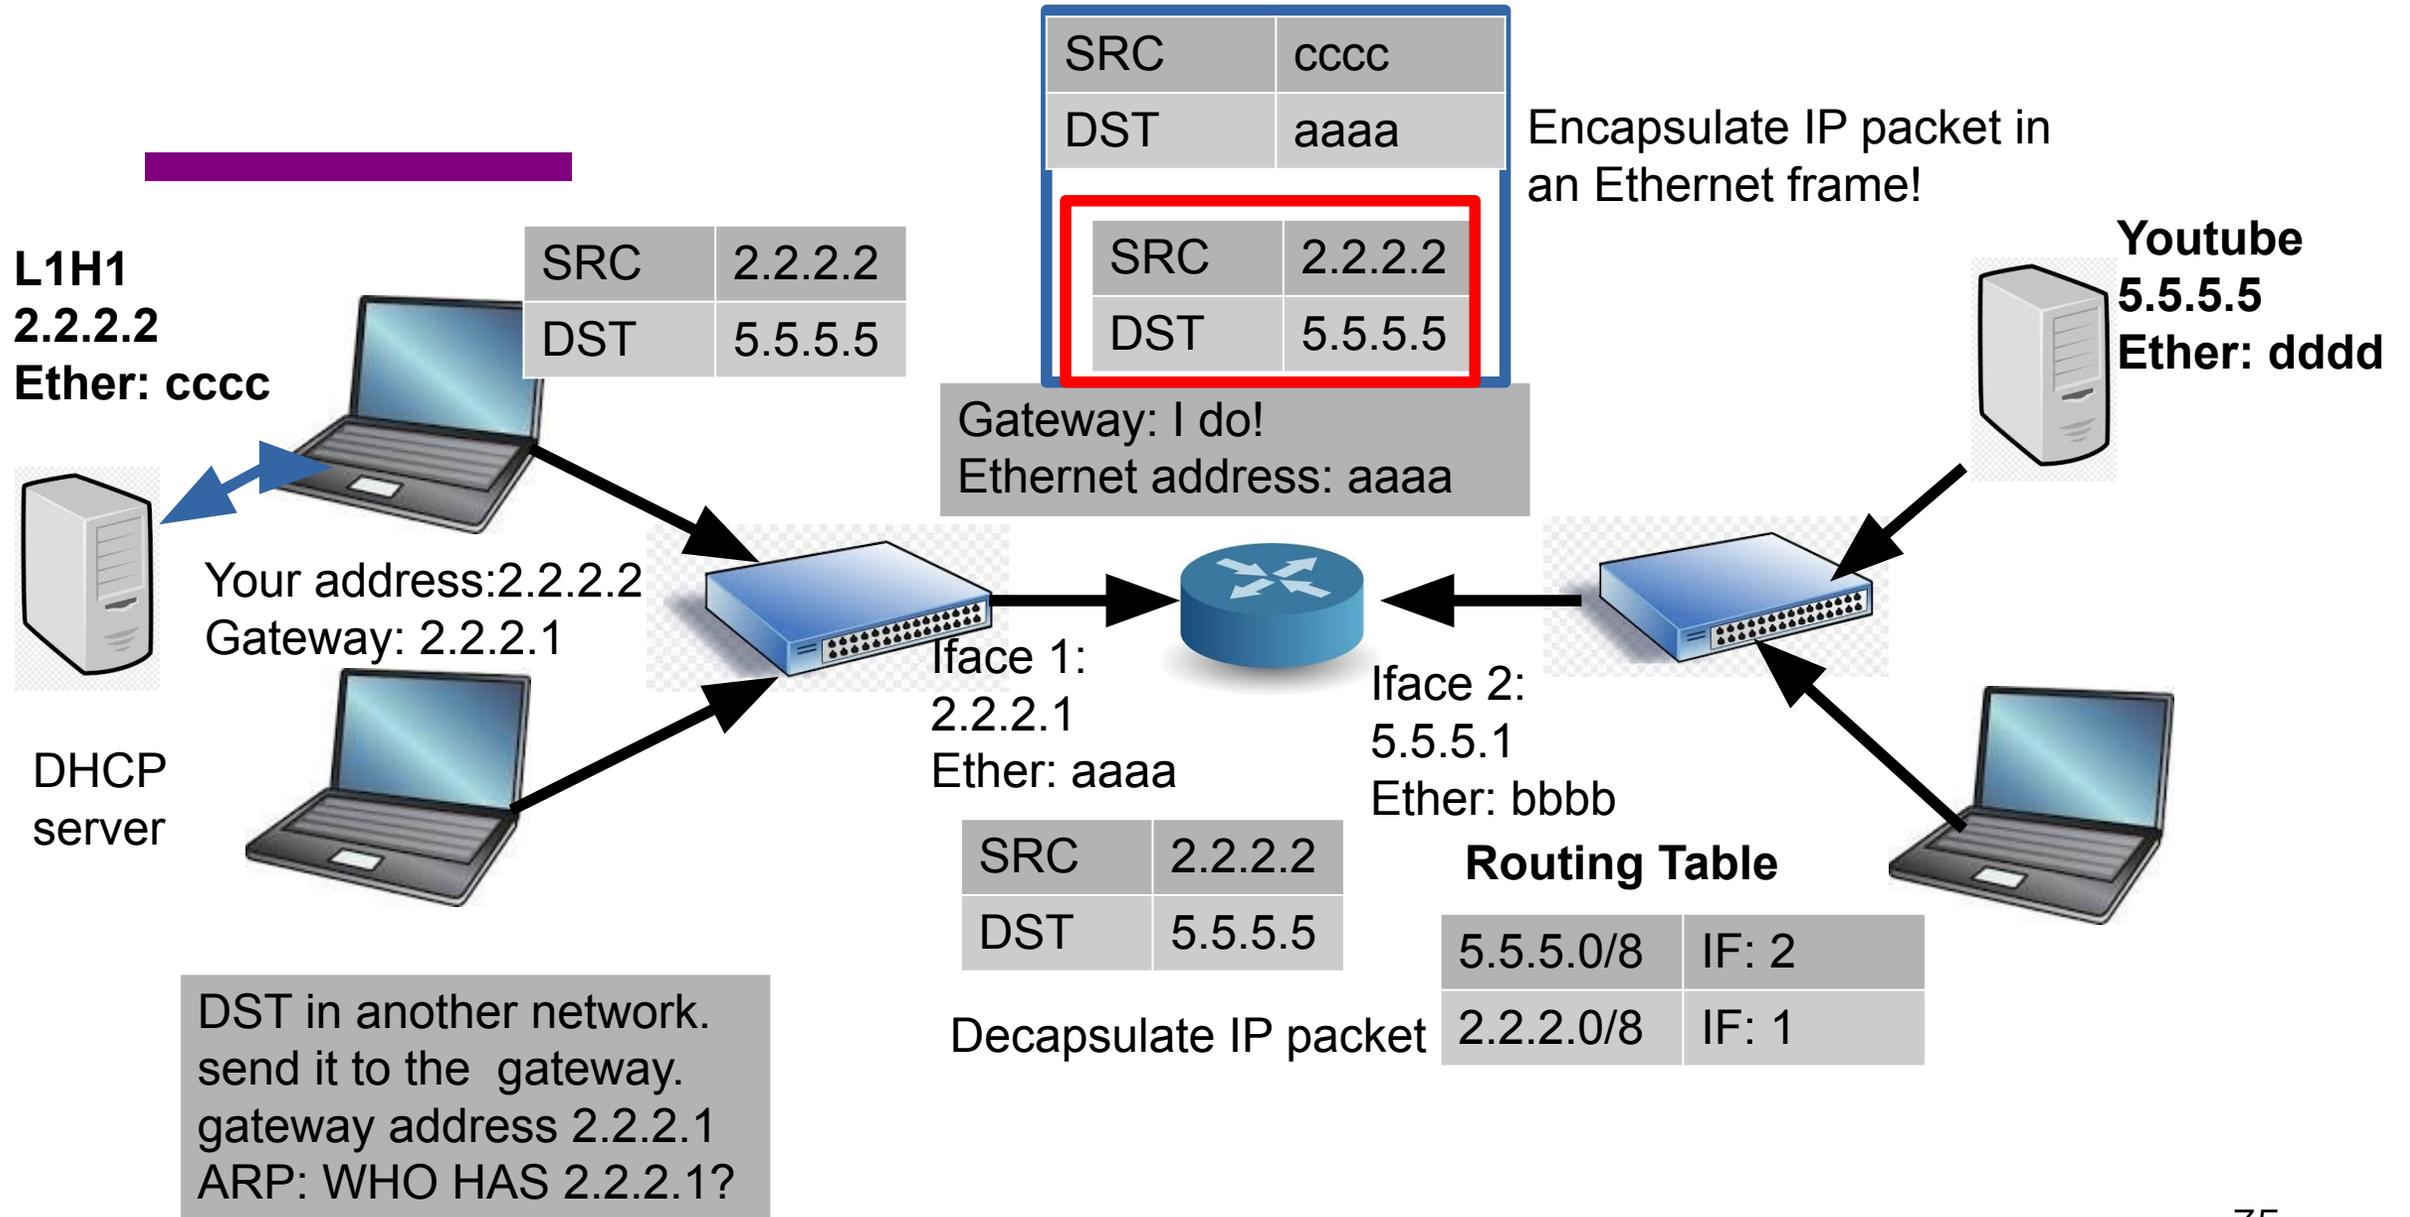

. Tying it all together in the network layer

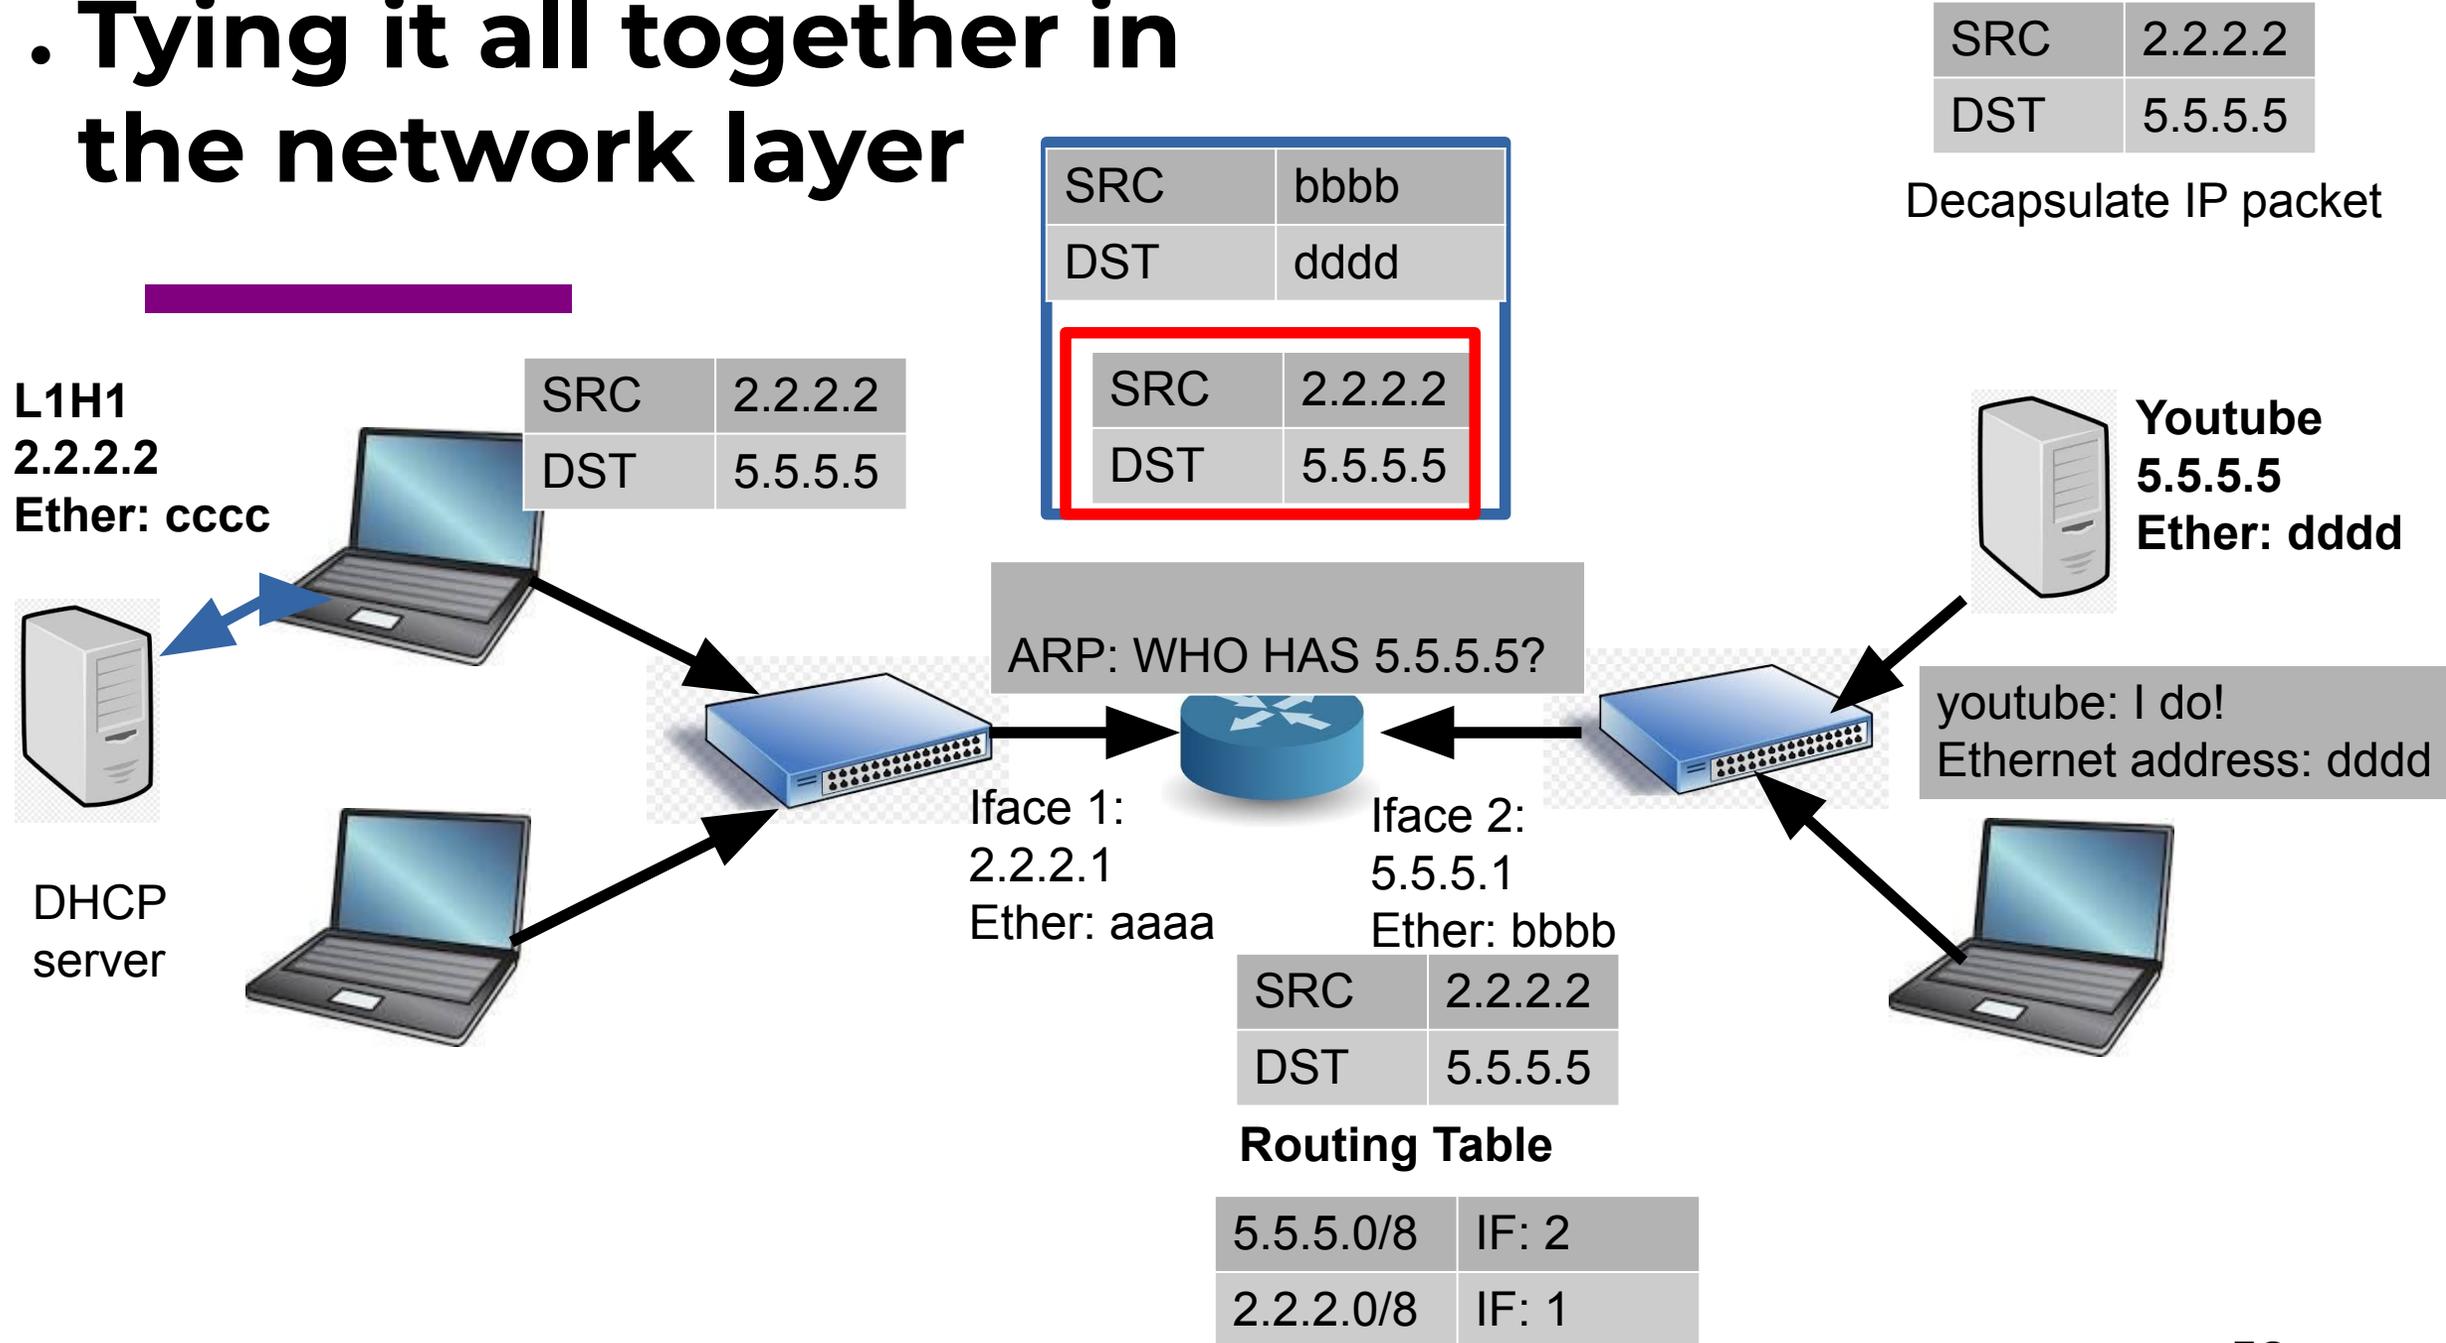

Internetworking Protocol (IP)

. Tying it all together in the network layer

. Tying it all together in the network layer

Next Steps

Wait - how are the routing tables populated?
Read through chapter 3.2.

Very useful video: <https://www.youtube.com/watch?v=rYodcvhh7b8>
